seems TIFKAS will only hear what he wants to hear or see. Who's wearing the "rose-coloured glasses" now? Especially in light that it's apparent that Bi66 6ates is using Apple to crush both Netscape and JAVA development - even someone with half a brain can see this coming. Not to mention the fact that he's now legally put a roadblock in front of any anti-trust action taken against him by Washington. Mark my words, if Gates accomplishes what he needs with his "deal with the devil", Gates will crush Apple like a bug - as he has with anyone who stands in the way of his goal of total domination of the industry.

Let's not also forget TIFKAS' Limbaughian logic - this idiot, who has admitted that his only experience with an Atari computer was with a 520ST years ago, sets himself up as an "expert" on Ataris and TOS systems. When he gets this info wrong, also expect his "facts" on Macintosh to be suspect as well, and does this excellent computer platform a disservice.

Not to mention TIFKAS' constant mistaking his computer for his manhood. I'm sure he's a real devil with the ladies (said in my best Comic Book Store Guy accent) :)

It's a third party add on. It's silly to object to that when Ataris
virtually require third party add ons (software graphics accelerators) to
be useable.

>I have formatted two disks, this morning, I think. Just quick formats,
>though. Why? Because I needed to free them up and put in my box of empty
>disks.

There are quickformat programs available on the Mac as well. Or you can
simply dump all the files on the disk into the Trash and empty it. (Not
necessarily as good as a quickformat, of course.)

If you're going to thump on Macs, at least do it reasonably. :) I can
think of a large number of things wrong with them which actually do affect
daily use (mostly having to do with the OS). Some of them are correctable
with add-on software, some of them aren't.

Astoundingly, he is correct in this case. Microsoft Internet Explorer for Mac has been the lone Mac exception to Microsoft's normal penchant for bloatware for some time now. It probably has something to do with the facts that they started from the Mosaic codebase instead of writing a completely new browser, and the programming team working on it is completely independent of the rest of Microsoft.

> I can still run a good Atari text editor within ONE-TWO megs
> without breaking a sweat. Try again, weinerhead - the other one's got
> bells on it :).

Non-Microsoft products: BBEdit 4.0, a very powerful programmer's text editor for the Mac, will run in 700K of RAM. WordPerfect 3.5.3, a very good WSIWYG word processor, will run in 1200 K. These are minimum allocations, so assume 500K to 1 MB extra to make things really comfortable.

> Judgements should only be made on operating systems when the public can

It is, however, possible to touch and use the direct ancestor of Rhapsody, OpenStep. Rhapsody is just OpenStep with a reworked interface and added features.

> The same goes for making judgements on computer
> systems - TIFKAS has never used a Hades/DirecT, therefore his opinion on

I agree with this only to a certain extent. It's pretty clear that these machines are overpriced in terms of features / speed per dollar (or whatever you use for money). This is only to be expected, since low production volume is always going to force prices up.

Peter of course has no business continuing to post his drivel, despite the fact that there is a tiny core of truth behind it. Does he really think that anybody who chooses to use Ataris isn't aware that these machines are expensive? He is essentially just trying to push his preferences on everybody else. He should be aware by now that to some people, the expense is worthwhile because they get to keep using their preferred operating environment. MagicMac is not always an option because its compatability (with both the host computer and Atari software) is not necessarily so good.

The netscape thing is more symbolic than anything else. Right now, if you install MacOS 8, you will get both MSIE and Netscape. Netscape is the one that is enabled in Internet Config as the default browser to use. My understanding is that the agreement will simply cause MSIE to be the default instead. You still get both.

Java is way overhyped.

No, the sword cuts both ways. If Gates destroys Apple as an effective second desktop productivity platform, the DOJ will be on to him in an instant. They were already snapping at his heels a couple years back, and that was *before* Apple's current wave of troubles. Gates needs a strong second platform in order to keep Microsoft from being broken up by the trust-busters. He probably can't afford to influence it too directly, either. (In fact, if you notice, there are some important limitations in the recent deal, designed to limit MS influence -- the $150 million worth of stock MS bought is non-voting stock, and MS agreed to keep it for three years, so they can't threaten to dump it either.)

>When he gets this info wrong, also expect his "facts" on

His facts on Mac often are wrong. No surprise there.

I did not state that TOS sucks..

However, there is nothing efficient about TOS because it lacks many
features and functions. If TOS could do what Wintel 95 and OS 8 can do
in compact form than you would have a point.

And what do you mean by GUI usage. Can your TOS run the latest modern
apps such as multimedia, web content and Internet tools?

Whoopee!!! IE requires 4 megs to run smoothly. And what does a text
editior have to do with a web browser?

However, you will come back and state that Cab -which has been panned in
Comp.sys.atari.st- still blows it away...

When did I state that "Calamus is crap"? I did state that it is not
upto par with PageMaker and Quark but never stated it was crap...

Rhasopy is real and has been shown at MacWorld...DR1 will be out next
month to the lucky ones.

You may have a point it is vapour..

You need to get a grip..Unlike you I do not fear MS. There always will
be a choice(s)..

You need to read the fine print.

IE will be the default browser on shipping Macs. Users still can still
load up Netscape and delete IE.

Competition is good and forces them to improve and innovate. Netscape
still has 70% of the browser market. They will have to improve their
offering by making it more stable and less memory requirements. MS has
gone along way with IE and with the new version 4. It helps to have a
dedicate group Of Mac developers in San Jose, Calif and not a Wintel
port. Hopefully Office 98 will be Mac specific.

Oh PhulEaZe! TOS can't compete with OS 8 and Wintel 95.. What part do
you not understand?

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn�t it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It�s called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That�s less than one phone line would cost per month.

For more information please visit our web site:
http://www.mynumber.com

* Based on our best priced plan.
* Canada has a higher per minute rate.

Huh? Since when is unix no game? Unix was made for the
single purpose to run a game (space invaders?) on a pdp-11.

And since then no adventure game I have seen has beaten unix.

Geez - these kids. Unix _is_ a game. Awful front-end for shure, but hey... And Windows is just a shell for running multiple sessions of edlin (remember: word for windows - from the guys who brought you edlin).

If I would work to get done, I wouldn't use a computer.

Dear Internet user,

If you are paying for your Internet services then you have not heard about 1stFamily. We have a marketing method that guarantees you will not have to pay one dollar to access the Internet.

* You will never again have a busy signal !

* You will always have the fastest access you have ever seen !

* Residual income for the rest of your life !

* and much much more.

This opportunity is for YOU to take advantage of !

Do you wish to continue the rest of your life paying $19.95/month to access the Internet when you can access it for free with speed and reliability that exceeds the other competitors ??? We did not think so. That is why our company is the best and fastest growing of it's kind and will soon compete with AT&T and MCI and all the big companies in providing Internet Service.

For complete information please mailto:ASE1000@1stfamily.com
and type "More Info" in the subject box.

You will receive our webpage address where you can get enrolled in
seconds !!

$50,000.00 for only $5.00 within 2 MONTHS?????
==

You gotta be crazy! How on earth do you think you can buy 50 grand for lousy 5 bucks? Well, that's what I was wondering, too until I came across this letter.

First of all, IT'S PERFECTLY LEGAL! (Call 1-800-725-2161) if you have any questions about the following opportunity to make $50,000.00 and that probably WITHIN LESS THAN TWO MONTHS!

Well, here it goes:
A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $5.00! So I thought, "Yeah, right, this must be a joke," but like most of us I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 5 names and address stated in the article. You then place your own name and address in the bottom of the list at #5, and post the article in at least 200 newsgroups. (There are thousands) No catch, that was it.

I knew that that was the opportunity I had waited for for a long time. I thought it was about time that the money of the world gets into the right hands! OURS, right? I never had a doubt that this thing will actually work and even if it didn't, what were 5 stamps and $5.00 for a try?

As I mentioned before, like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!

Now, that's how your story WILL sound like, too if you participate:

Well GUESS WHAT!!... with in 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had made a total of over $1,000.00!!!!!! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in ....

Let me tell you how this works and most importantly, Why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 Robert Jezil
114 Jefferson Ave.
Slidell, LA 70460

#2 Phil Walther Jr.
9495 Annapolis Lane North
Maple Grove, MN 55369

#3 C. E. Burkman
170 University Ave. W
Suite 12-129
Waterloo, Ontario
N2L 3E9

#4 A. Bailey
1207 Reeves Road
Plainfield, IN 46168

#5 J. Martin
   P.O. Box 2292
   Reston, Va. 20190

STEP 2: Now take the #1 name off the list that you see above, move the other names up (2 becomes 1, 3 becomes 2, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:
1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used, something to catch the eye!!!

3) Now go to the message part of the box and retype this letter exactly as it is here, with exception of your few changes. (remember to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL YOU SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and click the 'TO NEWS' button again. Type in your flashy subject in the 'SUBJECT BOX', then go to the message and place your cursor here. Now click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click on attach file then find your letter wherever you saved it. Click once on your file then click 'OPEN' then click 'OK'. If you did this right , you should see your filename in the 'ATTACHMENT BOX' and it will be shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:
It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**

Now the WHY part:

This entire principle works because it is in a format of an upside down tree with thousands of branches. Everyone below you will see to it that the tree continues because they want to get money. Those below THEM will continue because THEY want to get the cash etc.

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM of 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00
at #4 $225.00
at #3 $3,375.00
at #2 $50,625.00
at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 and start posting again.
The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! And this will go on and on and on and on.... get the picture? Well, there's 5,000,000,000 people on the world and most of them will eventually end up being hooked into the internet. So there are virtually unlimited resources. Of course this will work the best at the very beginning so the faster you post, the better for YOU!

So can you afford $5.00 and see if it really works?? I think so! People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income.   Thanks once again...

We are a New York based international photo agency representing professional and amateur photographers in search of having their work promoted in order to conduct their profession or hobby minus the time consuming inconvenience of presenting and selling their own work.
You do not have to be a professional photographer to sell your photographic work successfully, and as any pro will tell you, quite often throughout history an amateur
stumbles on a scene that he or she photographs and ends up with a photo that becomes a classic. Those who publish magazines, books, newspapers, greeting cards, record albums, or just about anyone who works with images in their profession,

are in desperate need of fresh material, and are more than willing to review photos
submitted by professional photo representatives. Sometimes the photos of amateurs are sought after more so than professionals because of accidental originality and innovative themes.
At Photo Phoenix International, we delight in and value the work of people who view
photography as a fine art and understand a photo representative's significance in terms of a photographer's career, reputation, and monetary gain.
The photos we are seeking are some of the following: ANIMALS, ARCHITECTURE,
ART, AUTOMOBILES, BUSINESS, CELEBRITIES, DOCUMENTARY,
ENTERTAINMENT, EROTICA/NUDITY, FASHION, FOOD, HEALTH, HISTORY,
HOBBIES, OUTDOORS, PEOPLE, POLITICAL, PORTRAITS, STILL LIFES,
RELIGIOUS, SCIENCE, SPORTS, TRAVEL . . .
Whether your work portrays conservative, experimental, stylish, or innovative themes,
your project proposal should be well thought out before submitting to us.
For first contact, submit a query letter and "SAMPLES ONLY" of your photos.
You must include "2" self addressed, stamped envelopes--one for correspondence, the other for the return of your material should we not be interested.
If we think your work is sellable, we will respond as soon as possible. Do not send
entire portfolio unless we ask for it.

One-Number service puts you in control of your calls while ensuring that your calls,
messages and faxes reach you regardless of your location. One-Number service
does this by linking your existing telephones, cell phones, pagers, and fax machines
through a single telephone number.

YOUR One-Number ACCOUNT COMES STANDARD WITH THESE
FEATURES

- Consolidates your phone, fax, voice-mail and paging services
- Works with your existing products and services, no need to change
- Easily lets you designate yourself as available or unavailable
- Rings you at up to three numbers simultaneously
- Never-busy number accepts multiple incoming calls and faxes
- Call Screening (by name) lets you know who is calling
- Call Waiting lets you know somebody else is calling
- Call Move lets you easily transfer calls among different phones
- Call Conferencing allows conferences with other parties
- Fax Notification on your pager for incoming fax messages
- Redirect calls to Personal Operator (live person) if desired
- AND MUCH MORE

Virtual Office Communications Company is not a phone company, a long distance carrier,
nor do we sell telephone equipment, cellular phones, cellular service, pager or pager service.
Instead, we offer service to integrate your existing products, adding value to what you already
have by letting your phones, pagers, fax machines and voice-mail systems work together
seamlessly.

To learn more please visit our web site at: http://www.mynumber.com

Please do not reply by e-mail as we are not set up to respond to e-mail requests.

Hello sports fans..

You thought that the A4000T pricing is absurb, check this out..

Just got this off a web site. Apparently there are currently 68040 boxes still being sold. This box is called a Hades and runs on the old defunct Atari TOS operating system. I could not believe the pricing on this.

Here is what you get for $2499 for the 040 and $2999 for the 060 version.

The SuperMac C500/180 Mac OS clone is Umax's least expensive lowend that is priced at $945 and is more powerful than the $2499 box.

This 040 Box does not have web development tools, inadequate internet tools and so on.

However the Mac OS clone costs less does more and has all the rich web/internet apps available..

Technical Specifications:

Case:

Full size tower case with 6 - 5.25" open front bays (one is used for floppy), 3 - 3.5" internal bays, 250 Watt power supply, dual fan ventilation system, CSA / UL approved.

Dimensions: 620mm (H) x 190mm (W) x 455mm (D) Weight 2.5 Kg.

Installed Peripherals:

Keyboard: AT 101 key.

Floppy: 1 with DD, HD and ED compatibility.
Hard Drive: Quantum 850 Mb EIDE Hard Drive.
Memory: 4 Mb minimum, expandible to 1 Gigabyte via 8 slots, 72 pin (PS/2) SIMM.
Video: ISA bus ET4000 graphics card with 1 Mb DRAM and NVDI ET4000 driver,
Resolutions: 640 x 480 x 16.7 Million Colours, 800 x 600 x 65K, 1024 x 768 x 256 and
1280 x 1024 x 16 colours.
(expandible to PCI bus ATI Mach 64 with up to 4 Mb VRAM.)

DirecT40 Processor data:

Processor: MC68040 33/66MHz

DirecT60 Processor data:

Processor: MC68060 60MHz
Processing Power: 120 MIPS

MIPS is Millions of Instructions per second and is used to rate processing power and speed.

Internal ports:

4 PCI-bus slots
2 ISA-bus slots
1 VME-bus slot
1 EIDE (enhanced IDE) with max. 10MB/s for 2 devices
1 SCSI with max. 4MB/s for 1-7 devices (TT compatible)
1 floppy (DD/HD/ED) d.h. max 2.88MB

External ports:

Modem 1 (25 pin Dsub-connector) with max. 19,200 baud
Modem 2 (9 pin Dsub-connector) with max. 250,000 baud
Local talk (8 pin Mini Din) with max. 250,000 baud
Printer 25 pin Dsub (TT/Falcon-compatible)
Midi-In/Out
PC keyboard connector (standard)
mouse and joystick (Atari compatible)

Specs on the SuperMac C500 Mac OS clone..

Technical Specs

Upgradable Microprocessor

PowerPC 603e CPU card
Primary processor upgradeable with a 603e Socket Card
Built-in floating-point processor and 32K on-chip cache
40 MHz, 64-bit bus

Memory

16 MB RAM on motherboard, expandable to 144 MB
2 DIMM slots
DIMM memory modules should be non-composite, 168-pin, 5 volt, 64-bit with 70 ns access time or faster. Compatible with EDO or fast-page DRAM.
256K Level 2 Cache, upgradable to 1 MB

Disk Drives

Internal 1.2GB IDE hard drive
Internal 3.5" SWIM III 800/1.44 MB floppy disk drive that reads, writes, and formats Macintosh, Windows, DOS, OS/2, and ProDOS disks
Internal 8x-speed CD-ROM drive

SCSI Interface

SCSI bus allows connection of up to six external SCSI devices

Expansion

2 PCI Slots for PCI cards with standard brackets
2 serial ports
1 ADB port

Graphics

1 MB VRAM
16-bit color up to 800-by-600 pixel resolution; 8-bit color up to

1,024-by-768 pixel resolution (monitor must support EVGA mode to display 1024-by-768 resolution).

Audio

16-bit CD-quality SRS surround sound
Stereo audio in/out jacks.
Supports Apple PlainTalk microphone

Network

33.6 Kbps fax/modem (C500i/180 model only).
10 Base -T Ethernet (C500e/180 model only).
Two high-speed RS-232/RS-422 serial ports compatible with LocalTalk and GeoPort

Keyboard and mouse

ADB extended keyboard included
ADB mouse included

Size and Weight

Height: 4.0 inches (10.1 cm)
Width: 13.75 inches (34.9 cm)
Depth: 16.0 inches (40.6 cm)
Weight: 16 pounds (7.2 kg)

Power Supply

PC-Standard 121W soft/trickle power supply, which allows computer to be turned on or off through software or the keyboard's power-on key

Operating Environment

Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
Storage temperature: -40 to 116 degrees F (-40 to 47 degrees C)
Relative humidity: 5 to 95%, non condensing
Maximum altitude: 10,000 feet (3,048m)

Bundled Software (C500i/C500e models only)

Apple Mac�OS �
Adobe PageMill � Create your own waves

on the World Wide Web by building your own Web site with this easy-to-use application.

3-D Talking Globe by NowWhatSoftware � As the name suggests, this talking atlas gazatteer features every city, town, and hamlet known on the planet � 3,000,000 names. With 3,000 of those names spoken by American broadcasters and native speakers, you'll never again have to worry about stumbling over the pronunciation of places such as "Hubli-Dharwar" and "Masjed-e Soleyman."

Cities Below by NowWhatSoftware � Aerial views of the 40 largest U.S. metropolitan areas taken by infrared cameras. Zoom in close to see clear, detailed images of large buildings and landmarks. Plus overlaid street maps. Perfect for aliens planning an invasion.

C & G Conflict Catcher 3.0 � A multiple award-winning Extension Manager that deals with startup file conflicts and management. End startup confusion forever!

ClarisWorks � The original super-duper all-in-one program featuring word processing, database management, spreadsheets, charts, mail labelling, page layout, and cross-platform file sharing.

FWB CD-ROM Tool Kit � It positively "supercharges" the performance.

FWB H/D Tool Kit � "High-peformance disk management software that maximizes the performance of over 800 different SCSI and IDE devices including Zip, Jaz, SyQuest, MO, and virtually every disk drive available."

Grolier's Multimedia Encyclopedia � America's favorite interactive encyclopedia with 35,000 indexed articles, 15 hours of multimedia sound, 10,000 photos and illustrations, and 20,000+ links to the World Wide Web.

MicroMat TechTool Diagnostic � Everything you wanted to know about your SuperMac but were afraid to ask. TechTool displays thorough system hardware, software, and disk drive information; displays control panels and extensions; tests for damaged system files; rebuilds the desktop; and resets or zaps the PRAM.

Now Up-to-Date & Contact � The leading day planner software. Scheduling meetings is a snap with its network capability. And the contact manager insures you never forget an important contact.

Now Utilities � "The best-selling collection of file and system management utilities is guaranteed to make your Macintosh faster and easier to use." Allows you to find, open, view, and manage your files and folders more quickly and efficiently. Tracks down system conflicts and much, much more.

Quicken SE by Intuit � A starter kit of the popular financial management software. Tracks checking, savings, and credit card accounts. Reminds you when it's time to pay the bills.

Service and Support

One-year warranty on all parts and labor

Warranty upgrades and extensions available through DecisionOne

Online system support - www.supermac.com/service

Toll-free technical support - 1-888-600-4400, 6 a.m - 12 midnight Central time

Thanks for the advertising. Nobody every said that Mac hardware was
bad. But in your lifetime (which I hope is very short) a decent Mac
O/S will never see the light of day. Quote all you want of press releases.
A press release dosen't run applications, real operating systems do.
As usual, you have no idea what your talking about. I guess you can't
really, being a rampet bot, with no real idenity or ISP of your own.

Absurd? That's a bit strong.

Hmm, the one advertised in ST Computer does not use TOS, but N.AES.

>Here is what you get for $2499 for the 040 and $2999 for the
>060 version.

Looking in ST-Computer/Atari Inside, I see a Hades 040 offered by AG Computertechnik for DM 4100, a bit less than the price you quote. It includes:
HADES040
Big tower CE
Quantum FireBall 1,2 GB
ET6000 2MB PCI GFX card
32 MB EDO RAM
Mitsumi keyboard
SCSI cables
HD floppy drive
GK-drivers (?)
Mouse (Boeder)
N.AES

Quite reasonable, all in all.

>The SuperMac C500/180 Mac OS clone is Umax's least expensive
>lowend that is priced at $945 and is more powerful than the
>$2499 box.

Depends on how you count. The Mac is quite power-hungry, mind you.

>This 040 Box does not have web development tools, inadequate
>internet tools and so on.

Sure it does. QED used with CAB as an OLGA server works well for HTML editing. And for Mac-minded users, there's Homepage Pinguin.

>However the Mac OS clone costs less does more and has all
>the rich web/internet apps available..

It costs less, but I can't say it has *all* the apps.
And for what price?

The HADES I quote has thirty-two Megs.

> 2 DIMM slots

> Internal 1.2GB IDE hard drive

Like the HADES I quote. Except I think the Fireball is a SCSI drive.

> Internal 3.5" SWIM III 800/1.44 MB
>floppy disk drive that reads, writes,
> and formats Macintosh, Windows, DOS,
>OS/2, and ProDOS disks

Well, the HADES can at least handle Windows/DOS (They're the same!)
and TOS (I think, it has been the same format as DOS for about 10
years), don't know about OS/2.

> Internal 8x-speed CD-ROM drive

None in the HADES. =/

> SCSI Interface

I guess the HADES has that too, seeing it has the cables.

>   Expansion
>
> 2 PCI Slots for PCI cards with standard brackets

That's a bit cheap, no?

> 2 serial ports
> 1 ADB port

Where's the paralell port?

>   Graphics
>
> 1 MB VRAM

The HADES I quote has two MB.

> 16-bit color up to 800-by-600 pixel

Also, what chipset does this thing use?

>   Audio
>
> 16-bit CD-quality SRS surround sound

> Supports Apple PlainTalk microphone

I have no idea about HADES sound, save for the MIDI.

>   Network
>
> 33.6 Kbps fax/modem (C500i/180 model only).

Then we can strike this.

> 10 Base -T Ethernet (C500e/180 model only).

And this as well.

> Two high-speed RS-232/RS-422 serial
> ports compatible with LocalTalk
> and GeoPort

But still no paralell port?

> Keyboard and mouse

Wow.

> ADB extended keyboard included
> ADB mouse included

That too?

> PC-Standard 121W soft/trickle power

One surely can't exist without such a useful feature.

> Bundled Software (C500i/C500e models only)

I thought were were talking the model without a letter?

> Apple Mac�OS �

May I add that Apple Mac OS, even in its current version 7.6, does not
support such a basic thing as preemptive multitasking, nor has it got
memory protection. Both of which N.AES supports.

> Adobe PageMill � Create your own waves
> on the World Wide Web
> by building your own Web site with this
> easy-to-use application.

Don't use that program if you intend to publish your pages.
But I'm sure there's a text editor somewhere in there too.

As long as I can throw it out...

I must say that it sure is good to know that we have our own walking, talking Apple product catalogue on this group. Or was that Apex? Umax? Apus?

And now, since I have an idiot server, I'll have to include a lot of meaningless text. Please ignore the following part of this message.

    as usual, TIFKAS (whose entire "knowledge" of Atari/TOS consists
entirely of having tried an older ST system a grand total of ONCE), and
who relies on rumour and innuendo for his "facts" gets
it entirely wrong. He has never used a Hades/DirecT system or seen one
in action, and therefore is no "expert" on how well it runs. TOS is not
"old", and it's still being developed for in the way of alternate
operating systems like MagiC, Geneva/Neodesk4, XaAES, NAES, as well as
great applications like Papyrus, Calamus '96, Positive Image 2, etc.
And may I add that these applications don't require large amounts of
RAM/hard drive space to operate and scream under the excellent Hades
architecture (which I HAVE test-driven, as well as several of the mac
clones - if anything, these systems are at "parity", rather than MCIBTYC)

TIFKAS consistently trots out the same tired old arguments and accusations over and over despite being shown consistently where he is wrong (which can be proven by doing a search under DejaNews under "Peter Sinclair-Day" or "Sinclap" - his rants, in which he constantly refers to his detractors as the "Atari Jihad", who are "out to get him", makes for very amusing reading.)

>
>This 040 Box does not have web development tools, inadequate
>internet tools and so on.
>

Wrong again, weinerhead. Try CAB 2 (an excellent web browser that's Netscape 3 compatible), NEWsie (highly recommended newsreader/e-mail program), POPwatch (incredible e-mail account "previewer" program) AtarIRC (very good IRC program). As far as web development, the excellent Home Page Penguin has arrived and comes highly recommended for ease of use; as well, both Everest and Edith Professional feature kerzel files for making web page development via ASCII quick and easy.

>However the Mac OS clone costs less does more and has all
>the rich web/internet apps available..
>

(meaningless MCIBTYC stuff deleted)

unfortunately, the long-term support for this clone is currently in doubt, what with Apple's lowest stock ratings in 11 years, several of their clone makers (amongst them Power Computing and Motorola) having decided to pull out of clone development or putting all future development for WinTel machines, and Apple's "Wonder Boy" Gil Amelio jumping ship after only seventeen months at the helm (thanks in part to the other boneheads in charge of the company, amongst them Steve "gonna hold my breath til I turn blue" Jobs). Not to mention developers for the Mac disappearing right and left. Why abandon one leaky boat for another?

Honestly, the Mac is a great machine. However, lies and innuendo by people like TIFKAS (the Rush Limbaugh of the Mac World) only serves to further alienate users of other operating systems (like TOS) from even wanting to give the Mac to try. A shame, seeing that the REAL enemy is the Wintel/Bi66 6ates monopoly who have bamboozled the computing community into thinking an inelegant, buggy resource pig of an operating system is a "standard".

Food for though, Sinclap - plumbing is an exciting field. Look into it. After you see your psychiatrist to see if you can get your inferiority complex fixed. Honestly, mistaking your Macintosh for your manhood! :)

What do you mean by "a decent Mac O/S?" Do you mean that the Macintosh hardware will never (or at least for a long time) run a decent OS or do you mean that Apple will never produce a good OS for the Mac? The first possibility would exclude Linux and BeOS from the set of decent OSes. The second would either exclude Rhapsody from the set of decent OSes or preclude Apple from shipping Rhapsody.

Hi,
Does anyone have any of the following games for the Atari ST, or know where I could find them. They are all favorites of the past:

BombJack, Bombuzzal, Boulderdash, Nebulas

Thanks

Neil Bates

1) Are there any Atari ST newstand magazines left in the U.K.? The last one I could obtain here in Australia was "Atari World" (from Specialist Publications). That was in 1996. Is it still being published?

Also, what about "Atari Format" from Future Publishing?

Are there any Newstand magazines still published for the Atari ANYWHERE?

2) Whatever happened to Atari UK's plan to reintroduce the 520STFM (cost reduced design) at a price point of UKP159, in mid 1993. Sales were expected to reach 150,000. Did the plan eventuate, and if so, did it have any impact on the market (which at that time was in decline).

3) Did the Jaguar reach the UK and mainland Europe in volume, and is it still being sold there?

4) Has the Falcon been revived by any 3rd party after Atari's demise?

Okay, I hope some Atari users can help provide some answers to those queries. Thanks.

Subject: $$$$$$ NEW SYSTEM, BETTER THAN "ADD ME TO YOUR MAILING LIST" $$$$$$$
Date: 1997/07/13
Message-ID: <33c92259.0@news.unibe.ch>
X-Deja-AN: 256674939
Organization: 6
Newsgroups: comp.sys.atari.advocacy

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere near what I expected due mainly to people not sending in the money but rather spreading the letter without paying for it. I participated in that mainly as an experiment and found that there are a tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay" problem and, second, to create a monthly income. I came upon the solution and decided to start a new program. I decided that there were 3 things that this new program needed in order to work for everyone and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you will find this program to meet those requirements. I have put lots of thought into it and I ask that you PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional "loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in your financial need, you may pay me back if and when you can." You should find 5 or more people who will send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You should put your name on postition number 5 and move each of the other names up one position. The name originally on position number 1 gets removed. You should be able to contact each of your 5 or more people to see if they are going to be active this month. If not then you need to find one or more people to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.

Now I know that this would be extremely easy to do since I can think of at least 20 people myself who will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't expect for the rest of the people to do it either and you can't expect for this system to work. This system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in need! It is OK to use the internet to find people but I think it would be easier to find them through people that you know. This way it will be easier for you to contact them every month to ask about their being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60

Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = *** $39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this as a business. If you treat it like a hobby that is how it will treat you. You could even organize small meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help you in your financial need, you may pay me back if and when you can" to the following needy people:

What... No internet tools, where do you get that from ?
Don't write so stupid mail about things you don't know.
I am using my Hades every day with no problems to access internet.
CAB 2, AntMAIL, NEWsie, AtariIRC, AFTP are some of the programs
for the TOS platform.

>

The Mac is a great machine.

However, it depends on how you count.
The Mac is quite power-hungry, mind you.

There is a a release version of Linux for the PowerMacintosh. It uses the Mach 3 microkernal and version 2.0(1?) of the linux server. You can check it out at www.mklinux.com. There is no release version of BeOS yet despite the fact that you get the latest version (0.9) either by purchasing it from Be (you get the release version when it comes out) or by buying any PowerComputing computer. I can see how you might argue that Be is vapor because it hasn't broken the 1.0 mark yet (though it does run applications) but how do you argue against Linux?

> Again, just a press release. Will you be the first in line to purchase

But you stated that "...in your lifetime (which I hope is very short) a decent Mac O/S will never see the light of day." For you to be correct, Rhapsody (which, you are correct, is just a press release) must not ship within, say, the next decade. I was just pointing that out. I suspect that Rhapsody will ship withing the next two years but that is just a guess. And I don't understand your last question.

I am looking for the game called Phoenix, I know it was released for the 2600. That version is not the one I am needing. I am looking for a release on either the 800/XL, 5200, 7800, or the ST computer. I remember back in 84-85 reading a review for it, I do not remember what system it was released for. I REALLY need this game, if someone can help me out, I will pay $$$ for it. Please let me know by e-mail. Thank you in advance.

Sincerely,

Steve Flater

I don't. With Linux installed, the Mac is no better (or worse) than a PC or Hades. When I debated with Mr. Sinplop, I made the statements because he dosen't have the slightest idea what that (Unix, ect) enviroment consist of. I guess you could say what he dosen't know, won't hurt his ego. As far as the press release comments, I get sick and tired of "oh yea, where can I purchase Atari apps?" coming from his mouth. I surely can't purchase Be from the Mac Zone can I? Nor can I order the other package Rasporsinclairday. I don't go to KMart to get my Operating Systems, and neither do the Linux users. My god, there is actually a CD install version of Linux for the 030 TOS based machines, and if I am not mistaken, an 040 and 060 version for the Hades. With all being equal, this puts these machines on level ground. You even use a Mac to compile optomised code for the 060 using Motorolas software. For us one percenters, there will always be a "best" operating system. For Sinplop, there will never be one. And if there is ever a single one for all, you can bet that Sinplop won't like it, because it won't run "his" Mac.
Fell the power of MinT:). We don't need windows, we have consoles:) Tunnels through the front of your monitor, if you will:). Direct access to the honey:)
I know you left your Falcon a while ago. If you ever get a chance to see the 040 in action with a nice O/S installed, do so. It will at least change your memories:). In canada, go spin you head over a T060 TOS clone. Not a Mac Caddie, but a lean machine none the less. Well worth the price in the TOS market.

That is not correct. The Mac is better than both because it uses a better microkernal (Mach). It is also better than the Hades because it has a better price/performance ratio as well as better absolute performance. The Mac version of linux also gets upgraded aggressively because Apple funds the project.

I have seen 040 Atari computers in the form of the TT. I have also used very responsive operating systems. BeOS, OPENSTEP and IRIX spring to mind. The problem with the Hades is that you must sacrafice absolute performance for a responsive OS.

Greetings from 1stfamily,

As we all know unlimited Internet access is $19.95 / month with every major Internet access company. From Netcom to AT&T that price never changed. So what makes us any different when we are also charging $19.95 / month ???

Our Marketing Plan.

Our method is this. Unlimited Internet access for $19.95 per month. If you find our service to be extremely satisfactory, in which we are sure you will, you can refer our service to 10 of your friends and family. If you do , you will get free Unlimited Internet access with your e-mail address for life !

What we offer is this:

* The fastest, clearest Internet access in the world.

* World Wide Internet access in over 110 countries.

* An e-mail account that is also life time free if you refer 10 of your friends and family to using our service.

* America On-line for only $10 / month !

* Much much more that will amaze you !

Our plan is by the year 2005 we will be the world's ONLY Internet service providers. With our technique of offering you life time free Internet access we will be.

Please visit our web site http://www.freeisp.com/ any where from the world to know more about our opportunity and to even get on the wagon before every one else beats you there.

http://www.freeisp.com/

Please forward this message to all of your online friends. Wouldn't you want all of them to get free Internet access ?

-------------------------------------

Abdul (SPONSOR ID # SAF5197)
Stop paying for Internet access !

Cool, that is a good price.
Now try to run TOS apps as fast as the T060/Hades 060.
That is the general subject here as it is an Atari newsgroup:)

I do not get the point of this thread. Magic or Atari TOS is IMO the onyl operting system that is runs on 99% of all plattforms and takes advantage of the hardware features, such as interface, garphics, sound etc., with the 68k emulator beind the micro code. It thus keeps, what other promise (WinNT), not to mention Mac OS that runs only on Macs and clones and on some Amiga emulators, but not on standrad, widely used PCs.
Therefore, Atari Software will also run on the Mac and the UMAX, and probably at the same speed as a Hades T40 or T60. That should be enough for most applications. If speed is required or special OS functions, there is always the possibilty of coding native and using OS functions of the host.

What facts are incorrect. The absurd pricing came from your firm's
web page.

The fact is that the Hades is way over priced compared to the other
platforms that also have a rich software base.   This whole thing
about large amounts a ram and hd space is nonsense and you know it.
A fully decked out PowerMac and Pentium systems with 32-64 megs is
still hundreds of dollars cheaper. I don't think hd makers make
anything less than 2gigs today.   Thats what you call progress.

Typical..."We don't have it, so who needs it" ....

And what PowerMac clones have you used to compare it with? With Mac
OS 8 with a fully multithreaded native finder flies. I can't wait
until you state that the Hades will outperform it..

He he he he he. Even Atari fanatics think Cab sucks compared to
Netscape. When is this platform going to lead insted of being a
follower?

However, the Hades is cost prohibitive.

> (meaningless MCIBTYC stuff deleted)

The truth hurts..

> unfortunately, the long-term support for this clone is currently in

Really. From what I have read is totally opposite.. Power will be
shipping Mac OS 8 with their machines on August 4.

, what with Apple's lowest stock ratings in 11 years, several of
> their clone makers (amongst them Power Computing and Motorola) having
> decided to pull out of clone development or putting all future
> development for WinTel machines, and Apple's "Wonder Boy" Gil Amelio
> jumping ship after only seventeen months at the helm (thanks in part to
> the other boneheads in charge of the company, amongst them Steve

He he he he he he.. Nice try. Have you told Motorola and Power
this? At MacWorld next month, new machines with the Arthur and Mach
5 processors will be released.
And Macworld online has articles from their September print issue on
Motorolas new CHRP boxes with 66-80 mhz busses comming out this
quarter.

Also, Amelio did a good job of stabalizing the finances with positive
cash flow, improved the product quality and developed an OS roadmap
which is working. Mac OS 8 shipped on time this week and Rhasopy DR1
will be out in August and a head of schedule..

You need to get your facts straight.

Apple's low stock price has not bearing on their positive cash flow.

"gonna
> hold my breath til I turn blue" Jobs). Not to mention developers for
> the Mac disappearing right and left. Why abandon one leaky boat for
> another?

Where? What developers? Also Apple has picked up the hundreds of

Next developers who will make Rhasp. shine.

No problem..A machine that costs 1/4 to 1/3 the price of the
Hades 040/060 is a TOS savior as well as faster. What a
concept.

Could someone demonstrate a working ulimit on Linux, because 'ulimit -m' does not seem to restrict the RSS, and 'man ulimit' tells me the system calls are obsolete and/or unimplemented. You don't need to be a wizard to read the kernel source for the ulimit call (2.0.30,/usr/src/linux/kernel/sys.c):

```
    asmlinkage int sys_ulimit(void)
    {
         return -ENOSYS;
    }
```

So, what works and what doesn't?

Win '95 OSR-2.1 on CD with Fat32 Boot Floppy, FAT to FAT32
converter; $35 + 4.50 for Postage/COD, or offer.

Full install version. USB Support. This CD also contains
the Microsoft FAT to Fat32 converter.

Are you tired of losing up to 40% of your disk capacity
to the huge cluster size of FAT16, P-n-Pray that does
not work, poor pcmcia support, misidentified motherboard
resources, CPUs, ect?

Well, moving to the OSR 2.1 version of Windows '95 is the
answer.

Win '95 OSR2 also contains important patches, an expanded
(and debuged) drver library, PnP that works, GUI improvements
and bug fixes.

Yes - Some, not all, of these are available for as downloads.
Yet - The most important parts: *FAT 32*, the Kernel and GUI
enhancements, PnP improvements and proper CPU identifier codes
are NOT available for download and currently can only be
obtained with the purchase of a new computer or "memphis"
(Win'97), whenever that will be available.

The CD is the full install version. Included is a OEM cd-key, an OSR2 boot floppy for creating a new FAT32 partition, MS CVT.EXE for converting a FAT partition to FAT 32 detailed installation instructions. In addition to these instructions, there is full documentation on the CD.   There is no "paper manual." Except detailed installation information. Your current Win '95 manuals will still apply, with a few *highly documented* exceptions.

The primary reason for migrating to OSR2 is, of course, FAT32, which increases the storage capacity of your drive simply by keeping the cluster size at 4K, despite the size of your hard drive. It also recognizes partitions larger than 2.1g, the current Win '95 limit.

I was hoping to get $ 35 for the CD, Boot Disk and instructions,
+ 4.95 for USPS COD. I am, however, open to reasonable offers.
I will pay shipping on pre-paid orders.
E-mail for more information.
Jason

The ulimit command in the Bash shell uses getrlimit and setrlimit.
The RSS limit corresponds to what is listed for ``maximum memory''.

Don't trust the RSS column in the ps listing. It's misleading. For instance, it will count shared memory regions as though each process had its own copy.

I don't think the RSS limit actually works; that is, it's not ever checked under any circumstances. You can grep the whole kernel source tree (2.0.30) and you won't find a reference to it.

PHOTO PHOENIX INTERNATIONAL

We are an international New York based agency representing
amateur and professional photographers in the following areas: Galleries,
Business and Organizations, Book Publishers, Paper Products, Consumer
Publication, Newspapers & Newsletters Publication, Special Interest Publication,

and Trade Publication.
We are seeking photographers who strive for excellence in the aesthetic/
creative and technological world of images, who have the talent to capture
the setting and to convey the mood. Your work should reflect a genuine,
pervasive interest in photography as a fine art.
Whether your work portrays conservative, experimental, stylish, or innovative
themes, your project proposal should be well thought out before submitting to
us.
For first contact, please submit a query letter, direct mail flier/brochure,
tearsheets, slides, photographs & SASE.
For amateur photographers, send sample photos and/or slides.
TO ALL: Do not send entire portfolio unless we ask for it. If we are not
interested,
you might not hear from us, so please submit material that does not need to be
returned.

Send to:
Photo Phoenix International

Who's bragging? I thought it was quite clear that this MB is a worse
case scenario for a triton motherboard. If you had known enough about
Pentium motherboards to know that the 430FX is bottom-end, then you
might have actually picked up on this subtlety.

I run netscape a lot and haven't had many problems with it crashing. Since I've seen it crash on Windows 3.1, Windows 95 and the MacOS, it would be my opinion that Netscape isn't a very well engineered program. But then, that's my opinion.

The Mac is easier perhaps, but it's not ideal. "real" OS's allow dynamic memory allocation. Unfortunately, if you allocate 12 meg of ram to a program and it needs only 4 meg, then you waste 8 meg. I use to operate a BBS and used MacKennel. Since I sometimes would get packets of mail that required using 12-15meg of ram, I would have to set it that high, even though most of the time it only required 4-5meg. This is where RamDoubler would come in handy, as it uses the unused memory from a program that is over-allocated.

Most often, the memory is dynamically allocated and released when it's
not needed. Virtual memory is more effiecient and faster under unix than
it is under the Mac. I've seen cases on my Mac where the HD will grind
away for 20 minutes or more and still not have enough memory for the
task at hand. I have 16meg of ram and a 128 meg swap under Linux and
haven't ran out of memory. It also is extremely fast.

Win95 allows dynamic memory allocation. It's virtual memory is a bit
slower than Linux, but a lot faster than the Mac. When it comes to
virtual memory, the Mac needs an improvement compared to everything
else.

Bob

It sounds like your Mac's virtual memory size was misconfigured. Even
under MacOS 7.6, where virtual memory's speed has been improved, you
don't want to set your virtual memory size to more than one or two megs
larger than your actual memory size (the system's performance will
steadily degrade as the virtual memory size is increased). Sure this
doesn't give your memory size a big boost, but because correctly written
applications utilize memory more efficiently just by turning on virtual
memory you'll get more than your one or two Meg's worth of available
RAM.

Win95 DOES dynamic memory allocation, but from a static RAM pool size (i.e. physical RAM plus a swap file). WinNT does static RAM allocation with a preset swap file, but dynamically increases the swap file size as more memory is needed up the amount of free space on your hard drive.

I would think in this multimedia age that midi ports would be very common. However...The only major manufacturer to ever recognize this need was Atari. Why? And why does hardware for audio applications cost so much more for the equivalent (8 analog outs, optical I/O, etc.) Atari-oriented pieces? Maybe I'm incredibly dense, but what would it cost to build a dedicated music computer, with adequate horsepower for net apps, etc.?

The basics of a PC is that it must be hard to maintain,
it looks more professional in that way. :-)
It would be too easy to use a PC if the manufacters
was thinking of making the PC user friendly.

If the PC would have any MIDI ports on the mainboard
it wouldent be at the specifications.
It would have diferent connectors and different midi protocol,
and then called it EMIDI (Enhanced MIDI).... he he he....

Darin Johnson (darin@usa.net.delete_me) wrote:
: >: "theater"/"theatre" is even more trickier.

: For both those words, I have spelled them both ways, depending upon
: having seen one particular spelling a lot recently. It's not like
: it matters much, no one will be confused.

"Theatre" is an artform which is often practiced in a "theater". I get
tend to get peeved when they're used wrong.

: But isn't "lorries" slang? Most of the differences between British
: style and American style English is in slang; official texts, dictionaries,
: and grammar guides are very similar in language, it's the spoken speach
: that differs the most.

lorries == pickup trucks ??? This seems to make more sense in telling the
difference between a little thing with two axles and a big thing with 18
wheels.

: Americans have no trouble reading Agatha Christie or Dorothy Sayers.
: Most have no trouble following along Monty Python either (after some
: practice). I listen to the BBC radio every so often, and I detect
: almost nothing different from NPR radio newscasters, except for
: accent.

Trouble following Monty Python? Some computer guy you are. ;-) <ni! ni!>

: Well, to Americans, an "upper class" sound is not "nicer". But this
: is a silly statement anyway, as Cockney English in no way sounds
: "upper class" (you said even when mispronounced :-).

I guess "upper class" means you don't burp and scratch while talking.

: The problem here, is that there is no one accent. American

: pronunciation may not vary as much as in the British Isles (talk for
: a few minutes and some people may be able to tell you exactly what
: town or district you grew up in; just like in Germany), but it does
: vary quite a bit. People from Nashville, Boston, New York, Texas,
: Detroit, and San Fransisco all speak very differently. (and Canada,
: it's an American country, so they must then speak American English
: too)

Speech patterns vary a LOT in the US, perhaps more so than in the UK.

: So, when you speak British English, which of the hundreds of accents
: do you imitate? When you try to speak American English, which of the
: hundreds of other accents do you imitate? What's "real American
: pronunciation"? Most of this bickering is just over ego anyway. Both
: places have a long history since the dialects diverged, and none are
: more right than the other, except for ego and nationalism.

Ever notice that dialects seem to be diverging?

Check again. Win95 also dynamically increases and decreases the size of
the swap file--I've seen mine go from nothing to half a gig and back.
Perhaps you have Windows 3.x in mind?

Yes- you can even choose what you prefer- If you like you can specify
low/high limits of the swap file- or you can let Win95 handle it all- in
that case the swapfile will be almost zero if you have plenty ram. WinNT
can have multiple swafiles on multiple disks- thats the only difference
I know about

|> to a program and it needs only 4 meg, then you waste 8 meg.

Unless you are running an efficient virtual memory implementation like
RamDoubler or Apple's Virtual Memory. Then those "wasted" megabytes
of ram are only virtual; they aren't real.

Yes.

No. Most often, memory is dynamically allocated, and held by the
program until it quits.

|> Virtual memory is more effiecient and faster under unix than it is
|> under the Mac.

I would want to see benchmarks before I accept that. It _used_ to be true, because System 7 through 7.5.2 (I believe) had pretty poor virtual memory implementations.

|> I've seen cases on my Mac where the HD will grind away for 20

That can be fixed.

|> I have 16meg of ram and a 128 meg swap under Linux and haven't ran
|> out of memory. It also is extremely fast.

Depends what you're doing, and how much of that 128 meg swap you are actually using.

Benchmarks? References?

|> When it comes to virtual memory, the Mac needs an improvement
|> compared to everything else.

VM on the Mac has received dramatic improvements over the last year (and a half? When did 7.5.3 come out?). And it will get better still with MacOS 8, and Rhapsody.

There is a difference between the OS handling virtual memory, and
the program requesting and holding dynamically allocated memory. Just
because a program does the later does not mean that the OS won't
page out piece of it.

Its still true. I have no idea what sort of meaningful benchmark
you could devise between Unix and the Mac, but I use both, and
its no contest.

Amazing. Now the Unixen are saying "don't confuse me with benchmarks or facts. My mind is made up." What's funny is that his answer is at least partially right, but it's trivial to test to find out for sure.

One reasonable test would be to run a given benchmark with and without VM on each system.

On Unix, I don't know if you can actually shut VM off, but if your benchmark fits into RAM, it shouldn't have to hit any paging, so there may be _no_ performance penalty. At the very least, I think everyone would admit that the performance penalty for using VM is small in most cases.

On MacOS, you _can_ shut VM off. So, you start the machine with VM and run the benchmark. Then, you reboot with VM off and run the same benchmark. The percent slowdown is a measure of efficiency.

If you're running MacBench or Speedometer, VM only slows MacOS by a couple percent (2% on MacBench last time I checked). Speedometer shows no difference. Other applications show a larger difference.

So, MacOS costs you a couple percent in performance when you turn VM on. On a few apps, you might get a bit more. How this could be "no contest" (even if Unix has a zero percent slow down) is an open question.

One problem I can see with VM on the MAC is the fact that it's co-operatively multitasking. The problem here is that, once a page miss occurs, the system can't just switch on another waiting task, but rather the time used to transfer the missing page from disc becomes real wasted time.

I'm reading this from an Acorn newsgroup. The RiscOS system also uses
co-operative multitasking, and from that I can say that VM is a real
laugh when compared to something like Linux.

This may be the same with the Mac, that's why Roger thinks it's not
worthwhile to actually run a benchmark, the difference is clearly visible.

You're proposing a single benchmark task as comparision. That's not really
usefull, because it's the system performance that counts, not the
performance of one benchmark.

BTW, the figures (2%) you gave are quite meaningless - I suppose it's
the processor time used when VM is NOT actually used, but switched
on. What really counts is how your system, the task in question as
well as other tasks, the gui etc reacts when the system is actually
loaded.

Kind regards,

Hi,

This is a Solicitation Email, we are looking for new TUFF'97 DISTRIBUTORS.
TUFF'97 is a promotional concept for a prospect follow-up system called
"Simple Track". Software designed for Windows 95, 3.11 and NT
machines. (Macintosh users read the NOTE below(*))

Concept:

The TUFF'97 software includes a copy of Simple Track, so you can use this
for your own personal administration (free). However, the TUFF'97 software
is designed to give you BIG TIME credits for just taking the efforts to

PROMOTE it.

How do I get those credits?. Easy, just distribute/promote it. How? (Give away the software for free, put it on your website/homepage and let everyone download it. Give it to your friends, attach it by email etc). With a one time $40.00 (USD) validation code purchase, YOUR name becomes part of all sofware you sent out to your customers. When your TUFF'97 software gets validated, all your personal information is automatically integrated in the software, so everyone knows how to reach you by phone/fax or email and where to sent the check/money or cash orders.

Basically this is the concept. Offcourse you need the software to grasp the whole thing. Believe it, there is absolutely no marketing knowledge required, just ask for the software package, join and start promoting your own TUFF'97 line. The only thing you DO need is a PC or Mac(*) and Internet.

(*) TUFF'97 is only available for MacOS users running Connectix VirtualPC or Insignia's Sofwindows 95/3.11. A true MacOS version is not available.

When you're interested in becoming a TUFF'97 distributor and create your own distribution line, sent a mailto:FiReStArTeR@frodo.com and ask for your copy of the TUFF software (We'll sent you a download location and install instructions). This is a serious opportunity, so only serious responses are processed. If you're not interested, have a nice day.
Best Regards,
Tony Scott

MIDI ports a far more common than one might think.
The catch is that one needs a special cable to access
them. With the soundblasters going all the way back to
at least the Soundblaster Pro 8-bit, the MIDI ports are
piggybacked on the joystick interface.

Absolutely. I am not proposing any single benchmark.

My post was to a person who said there was no way to compare MacOS VM efficiency to Unix VM efficiency.

My argument was that it's not that difficult, at least on the Mac. Choose whatever benchmark you consider important (rendering 3D images, recalculating spreadsheets, switching between applications, whatever) and measure the time with VM on and with VM off.

I agree that Unix VM is better than MacOS. I just disagree with the statement that you can't measure this.

An interesting statement. I completely disagree. The quality of the VM system is completely determined by the rate at which processes complete in the system. Your measure would favor a LRU algorithm over a LFU algoritm because LRU tends to better approximate the mystical optimal paging algoritm. However, the LRU algorithm is seldom used in practice because it is very difficult to quickly evaluate recency.

> So, MacOS costs you a couple percent in performance when you turn VM on. On a few apps, you might get a bit more. How this could be "no contest" (even if Unix has a zero percent slow down) is an open question.

I'm sorry, but I don't see how this is an experiment at all. It seems to be measuring nothing of importance.

The quality of the VM is not "how much it slows down the MacOS" which is in itself a meaningless statement. How much an OS slows down is completely irrelevant because disk speeds (the major factor in slow operation with inefficient VM implementations) completely outweigh the CPU speeds (the OS speed, if you like).

The quality of the VM is measured by how efficiently it uses the RAM available to the OS. A VM implementation which wastes no RAM (every page of RAM is being used by some currently running process) is better than a VM implementation which is wasteful (process XYZ isn't doing anything useful but has 1MB of pages swapped into physical RAM).

The older versions of the Macintosh operating system had lousy VM implementations, as they would swap entire processes into and out of memory. Newer versions of MacOS are much better and there are third party add-ons which are excellent. UNIX traditionally has very fine grained pages, and so the implementation is often excellent.

However the actual task of comparing VM implementations is not trivial, and cannot be measured with simplistic "divide speed with VM on by speed with VM off and that's it" experiments. There are far too many variables involved (what processes are involved? what are they doing? could algorithms be rewritten to be more efficient wrt VM?)

And I doubt that the results would even be useful, as the MacOS and UNIX are too completely different to be comparable in this area.

You are talking about performance, not quality.

The quality of a system is measured by the extent to which it robust, reliable
and free of defects, and by how well it meets its specifications.

It's difficult to make a meaningful _performance_ comparison between a poor
quality system and a high quality system.

Multics was exceptionally slow. I also remeber that it was designed for
the Honeywell 6000 machines which, if I recall, have dedicated LRU
hardware. I've been reviewing paging algorithms and I can't find a LRU
algorithm that can run as quickly as a LFU algorithm without hardware.

I'm not arguing that LFU is a better approximation to the optimal algorithm. Simply that it is a better design compromise unless you want to throw hardware at the problem.

Word has been received that this year's MIST Atari show will be held on Saturday, July 26, in Indianapolis, Indiana. The organizers say this show, the ninth annual, will be the final one.

This year MIST is moving to the Post Road Community Center, 1313 South Post Road, on the east side of the Indianpolis area. The new location is between I-70 and I-74, outside the I-465 circle freeway.

Show hours are 10 am to 3 pm, Indiana time. Admission is one dollar. In past years this show has had displays by vendors, hardware and software developers, magazine publishers, and users groups. All kinds of Atari computers and related products can be found at these shows.

Organizers of the show are: Charlie Sears (317-535-4829), csears at doe dot state dot in dot us. Jeff Hammer (317-244-8492), jghammer at indyunix dot iupui dot edu. Stu Huffman (812-988-7558), shuffman at doe dot state dot in dot us.

Fair enough, my measure of VM quality isn't as good as yours.

> Your measure would favor a LRU algorithm over a LFU algoritm

> because LRU tends to better approximate the mystical optimal paging
> algoritm. However, the LRU algorithm is seldom used in practice because it
> is very difficult to quickly evaluate recency.

LRU fails in only a few cases, like a process accessing 11 pages in repeated succession with only 10 pages free for use. It is fine for most purposes, and *has* been used in practical operating systems (Multics used LRU, for example). Evaluating recency is an issue, but no more of an issue than evaulating frequency.

LFU also fails in some rare cases. Consider a process which rapidly accesses a page for a short duration, then doesn't do so again for a long time. This will keep the page in memory even though it should be swapped out during the long duration of inactivity. Interestingly an LRU algorithm does the right thing here.

This is getting off the point though. There are lots of VM implementations and all of them have their failings, because none of them can really predict the future. My point was really to show that the amount of CPU used by the OS is *not* a good metric to measure VM performance, as the previous poster seemed to think.

I gave a (poor) example of a proper meteric, and you've given a better one. So you've done what I intended to do, and that should be all there is to say about the matter.

Hi,

For those into Atari and wanting new and fresh images of never before seen Atari product prototypes and vaporwares, please stop by and check out this web site.   Last night several new images were added such as a never before image of peripherals for the Atari Graduate keyboard like: Wafer Drive, Modem, RAM expander, Thermal Printer.   Images of the 5200 "System X" prototype and cartridges.   Also many many unseen images of other Atari items such as rare 8-bit computers, ST prototypes, stand alone systems, even an Atari California License Plate!   Stop by and take a look and the would been, could been of Atari....

What elitist crap. There are millions of people who know and care nothing about computers but use them successfully every day at work and at home. Do you think people should sit a computer literacy exam before they can touch a PC? Do you think that the majority of drivers know how a car works, or care?

I suggest you become a Christian. They also thrive on making pompous judgements about what other people should and shouldn't do, and as a group they have a lot more clout than Linux users.

After reading this post, I assume that the fascist that you are referring to in the title "Fascist alert!!" is yourself. Not only do you post elitist crap yourself, you take the opportunity to slight a group that you obviously know little about, and I don't mean Linux users.

First, people have to know how to use a car befreo being allowed on the street. There is an exam. Sure, maybe you don't have to know about the inner workings of the car, but you have to know how to use it. So I don't see the comparison here. People who try to use something without knowing at least something about how it works constantly frustrate themselves. That is where RTFM came from, the simple fact being that if people would take a little time and read the instructions, whether on the computer or in a manual, they'd save themselves time and effort.

Second, although I can't speak for all Christians (unlike yourself) I can say that the foundation of the belief for most is not making pompous judgements or any sort of discrimination. Just because Christians do not believe that everything is fine just as long as no one gets hurt doesn't mean we are pompous or bigoted. Simply we believe that there are moral lines that shouldn't be crossed, and that sometimes putting off immediate satisfaction is more important than simply doing what feels right. Of course, what this actually has to do with computer advocacy I don't know. If you want to spout off like the fascist that you are trying to alert us to, please do it elsewhere.

"My theories appall you, my heresies outrage you, I never answer letters
and you don't like my tie."

What has so fasistic about the paragraph above? (or maybe in the part
that has been snipped?) See nothing about color/religion/etc in it.

That sounds fasistic to me :-)

Ahh, I get it --- India, NA (India in North America). I never understood
why they called it Indiana...

Bernie

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax,
pager, voice-mail, and cellular numbers and give them your New "Virtual Office"
800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone?
Wouldn�t it be nice to be able to give everyone just ONE phone number that
will find you anywhere you are? Even out of town, or in a restaurant, or even
on the golf course.

Now you can.

We have the answer to all your communication needs. It�s called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That�s less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

Erm. I don't think that was a troll. :-) Just a case of some ninny who didn't bother to try and understand what he was reading before posting some knee-jerk, half-baked ad hominem with the notion that he might actually hurt someone's feelings.

shrug "Never attribute to malice what can be explained by stupidity."

An extremely good point I'd say, and probably the best commentary on
Christianity I've heard all year.  On the whole, I'd rather listen to
Linux users, as they occasionally have something interesting to say.

Agreed. There's nothing more irritating than someone who wants to use a computer but doesn't bother or even want to bother/care about how to use the damned thing. Eventually they come out of the experience saying that computers are difficult. *Using* computers is no more difficult than driving a car or using any other contraption. (Except of course if it's Windows :)

The whole idea behind computers is one of an intuitive, efficent medium by which to interface the with world. Computers are not necessarily supposed to be complicated, nor is it requisite for an end user to know what makes his machine tick. That's the beauty.

Most drivers do know how a car works. In Australia you have to undergo a 6 month training period, and then a long driving test, supervised by an expert driver, before they let you drive your own car. Similary for aeroplanes, there is a 6 month intensive training course before you're allowed to fly your own aeroplane without supervision.

My quote simply says that someone who has had training with a computer will be more productive than someone who hasn't. In another sense, the untrained computer user may actually be a hinderance, or even a danger to the computer and themselves, because they have no idea what they're doing. The abundance of computing tutorials proves my statement.

Computers aren't toasters. Strangely enough I needed training before I could use my toaster. I read the instruction booklet which said how to clean out the crumb tray, and what the two knobs on the front meant. I

find it ridiculous that people expect to use computers without opening
the manuals they get with them, when even toasters have instructions.

> I suggest you become a Christian. They also thrive on making pompous
> judgements about what other people should and shouldn't do, and as a

Don't be a moron.

--
The idea that an arbitrary naive human should be able to properly use
a given tool without training or understanding is even more wrong for
computing than it is for other tools (eg automobiles, airplanes, guns
or power saws).

Yes, yes. I agree with that part of your previous argument -reiterated above.

My point is that to use such a machine involves a willingness to understand how to *use* it. Knowledge of how it *works* is not a requirement. I agree. I don't know a single thing how electricity and a glass booboo makes my room all nice and light, but I *must* know that I have to plug the booboo in and turn on/switch on the little plastic thing on the wall so that I can interface with the world when the great fire in the sky turns off.

Kindly yours,
--

Funny, I thought the idea behind computers was to do arithmetic very
quickly.

```
--
/*  _  */main(int k,char**n){char*i=k&1?"+L*;99,RU[,RUo+BeKAA+BECACJ+CAACA"
/* / ` */"CD+LBCACJ*":1[n],j,l=!k,m;do for(m=*i-48,j=l?m/k:m%k;m>>7?k=1<<m+
/* |   */8,!l&&puts(&l)**&l:j--;printf("  \0_/"+l));while((l^=3)||l[++i]);}
/* \_,hris Brown -- All opinions expressed are probably wrong. */

Welcome to the modern world, where expecting people to educate themselves is considered elitist and even "fascist" (the original poster obviously has very little grasp of the term; dare I say he should read a book on the subject?) Ignorance is now fashionable, and people even wear their lack of knowledge as a badge of honor.

Dave Cook

ONLY AVAILABLE IN THE:
U.S.A, CANADA VIRGIN ISLANDS, AND PUERTO RICO

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn�t it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It�s called the "Virtual Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That�s less than one phone line would cost per month.

For more information please visit our web sight:
http://www.mynumber.com

* Based on our best priced plan.

You mean the one that revolves around the big flat disk you're standing in the middle of?

Actually, the glass booboo (a "globe" or "lamp" to us hardware types) does much better at warming your room than lighting it, unless you use flourescent booboos.

No, it's elitist to deny or restrict access to technology to people who are not educated (by whatever means) to your level of understanding.

> Ignorance is now fashionable, and people even wear
>their lack of knowledge as a badge of honor.

Ignorance doesn't prevent people from using computers these days. Why you resent this is unclear to me.

CitiBank, Wells Fargo and the US Treasury, just to name a few.

Hast thou forgotten the armies of accountants out there?
Wouldst thou condemn them to a lifetime of balancing spreadsheets by
hand?

It's not a matter of how many but of whom.
Those who pressed for the development of digital computers did
so out of the pressing need for fast arithmetic.

The rest is the result of using a difference engine for arbitrary
linguistic transformations...

    Yes it does actually. Watching this kind of ignorance in action can
    be rather amusing... (like the MacFool that thinks a UTP cable will
    fit into a phone jack (or viceversa))

    A spiffy frontend just gives the lazy a false sense of security.

Let's add Boeing designing the 777, Hughes designing a communications satellite, the big pharmaceutical companies modeling HIV protease inhibitors, the NSA trying to crack Chinese ciphers, the Massachusetts DOT trying to predict traffic changes when they close the central artery in Boston, Sears trying to tot up the day's earnings, various pension plans trying to earn money today on Wall Street, the trillion dollar a year international currency exchange market, NOAA trying to predict whether El Nino will reappear this year, and the DOE trying to use computer simulation of thermonuclear detonations to replace actual detonation of warheads.

I mean, duh.

What do you mean, that's what's easy to build with binary digital
electronics? The *only* thing binary digital electronics can do
is crunch numbers! Remember.. "binary" is a number system (base 2
to be precise).

I'd say lots of people need arithmetic done at blinding speed, ever
done any ray tracing? I fiddle around with backpropagation trained
neural nets every now and again, billions of arithmetic operations
are involved in relatively small neural nets during training.

The only reason computers exist is to do number crunching. Everything
you do on your computer turns into numbers.

Wow, this is some rewriting of history. And here I thought the purpose of computers was (a) initially, to do computations human beings can do in principle, but not in practise, and (b) later, also replace multiple office tools (typewriter, typesetter, draftsman, etc.) with one more general-purpose, programmable tool.

I thought one interfaced with the world by means of a face, good manners, and a voice.

Well, I guess this is where you and I differ. I would try to help the
person having problems, while you would apparently slope off sniggering to
e-mail your buddies about it. Takes all sorts.

Base 2 arithmetic is used because it's easy to build electronics that support it (I have seen base 3 done with 3 voltage levels, as an exercise). In fact the basic non-trivial digital operations are two-input gates. These build into latches and flip-flops, which build into counters and arithmetic engines. FWIW.

>I'd say lots of people need arithmetic done at blinding speed, ever
>done any ray tracing? I fiddle around with backpropagation trained

I'm not arguing that arithmetic isn't essential for computer applications. But in many cases applications are implemented arithmetically because that's what computers do, not because that's the best algorithm for the task. Why should word processors or linguistic expert systems be implemented in this way?

>The only reason computers exist is to do number crunching. Everything
>you do on your computer turns into numbers.

Huh? Computers exist to help people do things. You've got the cart and the horse backward :-)

I read Kiddy's message and concluded he was a Windows 95 user.
"The whole idea behind computers..." thing has been ingrained
in these people by the Redmond Propaganda Institute. A rewrite
of history and the constant influx of brainwashing to the MS
minions results in the kind of responses you hear from people
like Scott Kiddy. I didn't check his headers but I'll bet he's
running Windows 95 and interloping here in OS/2 Advocacy for
one reason: to push the Microsoft mantra: "The MS way or no way!"

Why should word processors or linguistic expert systems be implemented in this way?

Because without arithmetic you cannot define an algorithm. Or more precisely, you need a formal system to express an algorithm, and the smallest complete formal system is base-2 arithmetic. (All other formal systems are anyway logically equivalent to it.)

Besides conflating the algorithm with the formal system, are you sure you're not tripping over the fact that data in a computer is commonly considered "numbers" even when it needn't be? I mean, 0100011001001111010011111 can be considered with equal plausibility

to represent the number 4,607,823 or the word "foo" or the first
three bars of the 5th Symphony. And you can call the rules for the
manipulation of this and related symbols "arithmetic" or "English
grammer" or whatever you like without changing anything interesting.

Anyone whos played a game. Anyone whos done anything that draws anything on the screen... You at least have to work out offsets in to screen memory at some point.

Anyone who uses a keyboard, given that you have to convert keyboard key numbers in to ASCII. And then you have to work out how to draw it on the screen, or whatever.

How about a mouse pointer? etc etc...

Almost all a CPU ever does is work out what numbers to put where...

If we did, we would reduce the amount of paperwork cluttering our lives by 99%.

I also thought, that if every law drafted and proposed in congress or state legislature had to be written in longhand by the senator/congressman etc. himself, we would have a lot more sensible laws and less tripe/paperwork.

Over the history of the human race, many ways of writing have
been created; and the knowledge of how to read many of them has
been lost. Some people spend their lives attempting to rediscover
the key to these languages.

One of the most stunning decipherments of a lost language was
by Michael Ventris, who in the late 1940's and early 1950's
figured out how to read what was known as "Minoan Linear B",
a language discovered on thousands of tablets recovered from
archeology digs on Crete.

And what did those tablets say, once deciphered? According to
"The CodeBreakers" by David Kahn, sample texts read like this:

"Koldos the shepherd holds a lease from the village: 48 litres of wheat."
"At Pylos: five sons of the Ti-nwa-sian weavers (sons of rowers at A-pu-ne-we),
two boys."
"Four (or more) slaves of Koradollos in charge of seed-corn."
"One pair of wheels bound with bronze, unfit for service."

The bureaucrat, like the pawnbroker, has a valid claim to
"the oldest profession".

On Sat, 21 Jun 1997 22:51:37 -0700, Christopher Grayce <foo@savetrees.com> wrote:

>Because without arithmetic you cannot define an algorithm. Or more precisely, you need a formal system to express an algorithm, and the smallest complete formal system is base-2 arithmetic. (All other formal systems are anyway logically equivalent to it.)

I'm not a computer scientist, so forgive me if I don't know the jargon or use it incorrectly.

Would you agree that a logical inference engine such as Prolog implements a usable "formal system" which has reliance on arithmetic at all? I still think you're deducing that because our current procedural languages expose the underlying hardware's arithmetic capabilities, the solutions to problems implemented in these languages are best expressed in this way.

>Besides conflating the algorithm with the formal system, are you sure you're not tripping over the fact that data in a computer is commonly considered "numbers" even when it needn't be? I mean, 010001100100111101001111 can be considered with equal plausibility to represent the number 4,607,823 or the word "foo" or the first three bars of the 5th Symphony. And you can call the rules for the manipulation of this and related symbols "arithmetic" or "English grammer" or whatever you like without changing anything interesting.

I don't see how you can apply the term "arithmetic" to operations on data unless the data is interpreted as weighted digits comprising numeric values. What does character arithmetic or musical arithmetic consist of?

No, mate. If 99.9% of the kids (and adults) out there are to be believed,
the purpose of computers is to PLAY GAMES.

Digital Data Promotions Online is pleased to present a new yellow pages style listing of businesses on CD-ROM. This listing will include links to your businesses web site, text, graphics, picture, as well as audio and video clips; to bring your business into the world of multimedia advertising. In addition, any ads promoted on the CD will also be listed on our web site, in the same cataloged method, and updates to your information will be possible. We are currently promoting this CD across the US and the world, and space is filling up quickly. For further information you can visit our web site at

http://www.intergate.bc.ca/business/ddpo

Or download a quick demo of the program, and pricing list, with attached order form at

http://www.intergate.bc.ca/business/advert.exe

We hope to see you online soon.

Thank you for your interest.

Any questions or comments can be directed to

And of course, the vast majority of people who fund and develop further computer advances since their invention. Scientific computing, something today's average computer user thinks little about, has done more to change computers than all of corporate computing. (software on the other hand is a different story)

Sorry to force more pomposity down your throat, but I'm never comfortable
with the idea of having a laugh at the expense of someone who is having
problems due to technical ignorance or anything else. It strikes me as one
of the nastier aspects of human nature.

Performance is part of what decides the quality of a paging algorithm. All paging algorithms should be (because they aren't very difficult to implement) similar in regards to reliability and defects. I don't know what you mean by robustness in terms of a paging algorithm.

i don't agree
the real purpose of computers is to prevent your wife to give you the
(basket, dog, son...) bring outside during your 854 th attempt to kill
the boss of the eleventh level of this f... game...
Try to do this with a console plugged in the TV...

Marco

CALLING ALL LITERARY MINDS!

I am trying to compose a coffee table book on the topic of EXCUSES.� To add an original flavor to my project
I am attempting to derive my research entirely from people I come in contact with on the Net.
If you have, or know of, any interesting, unique, or even bizarre excuses, and would like to participate in this experiment
in creative literature, please reply to this message with your excuse.� Any excuse that is used in the published version will
receive full literary credit.� Thank you in advance for helping a fellow netizen. Long live free speech!

��
Sincerely yours,

�� Jason

ONLY AVAILABLE IN THE:
U.S.A, VIRGIN ISLANDS, AND PUERTO RICO CANADA*

BE SURE TO GO TO OUR SITE AND CHECK OUT OUR FREE TRIAL.

Call everyone and tell them to throw away all of your old home, office, fax, pager, voice-mail, and cellular numbers and give them your New "Virtual Office" 800/888 number! The only number any one will ever need.

Are you tired of giving out all of your different phone numbers to everyone? Wouldn�t it be nice to be able to give everyone just ONE phone number that will find you anywhere you are? Even out of town, or in a restaurant, or even on the golf course.

Now you can.

We have the answer to all your communication needs. It�s called the "Virtual
Office".

And this new service is loaded. It comes with features like:

An automated Call Attendant, Live Call Connect (in real time), Fax Sending, Fax
Receiving,
Even without a fax machine! E-Mail Notification and Delivery, Without a PC!,
Outbound calling, Low Cost Long Distance Service, Inbound/Outbound 800/888
Number, Worldwide Call Transfer, Call Forwarding, Call Screening, Full Service
Voice
Mail, Nation Wide Pager Notification, Conference Calling, Speed Dialing, Auto
Dial,
Auto Messaging, Temporary Greeting, Unavailable Greeting, Password Protection,
Pager Notification, and No Equipment or Software to buy, "Ever".

Priced from $9.95* per month, Plus 10.9 cents per minute per event.

That�s less than one phone line would cost per month.

For more information please visit our web site:
http://www.mynumber.com

* Based on our best priced plan.
* Canada has a higher per minute rate.

Dear Internet user,

If you are paying for your Internet services
then you have not heard about 1stFamily.
We have a marketing method that guarantees
you will not have to pay one dollar to access
the internet.

* You will never again have a busy signal !

* You will always have the fastest access you have ever seen !

* Risidual income for the rest of your life !

* and much much more.

This opportuinty is for YOU to take advantage of !

Do you wish to continue the rest of your life paying $19.95/month to
access the Internet when you can access it for free with
speed and reliability that exceeds the other competitors ???
We did not think so. That is why our company is the best and fastest
growing of it's kind and will soon compete with AT&T and MCI and
all the big companies in providing Internet Service.

For complete information please mailto:sameer@1stfamily.com and
type "More Info" in the subject box.

You will recieve our webpage address where you can get inrolled in
seconds !!

Mailloop is an Industrial Bulk Email and Newsgroup Broadcasting Program.

Visit http://205.199.4.219 for More info.

Here is just some of the many hunreds of Mailloops Features:

Send Bulk Email to Thousands of People an hour-

Send Bulk Broadcasts to the Newsgroups with an Anti-Cancel Bot Feature-

Send Binaries to the Newsgroups in Bulk-

Process your incoming Mailbox -

Build E-Mail and Newsgroup Lists From:

Extracting from the Newsgroups-

Extracting from a Whois-

By processing your incoming Mailbox-

By using the finger Client (You can finger a domain and extract all of the email addresses)-

Extracting From a Import File-

Extract from a Web Page-

Extract from an FTP Site-

And Many Many More.

If you interested in these and many other features that Mailloop has to offer, or to obtain a copy,

Visit Our Web Site:

Want to see something really amusing? Try running GCC in the background
on a Linux/X system and then run, say, doom or whatever.
Now try the same with W95 on the same system. I compiled a small program
in the background using DJGPP on a P75 with 8 Mb RAM. When I tried switching
back to Windows, it took the damn thing almost ten seconds just to draw the
start menu :) I haven't even _tried_ to launch Word.
While compiling a large package using GCC in a Linux environment will
ofcouse slow down the system a bit, it's still fast enough to at least do
something else. Like playing doom :) Don't run Netscape though... It will
eat up all of your memory and then crash :(

   Anything running MacOS, Windows 3.1 or Windows 95 fits this description
   fairly well, especially in the context to which I was replying.

   For those of us who would prefer to not merely use our computers as
   doorstops, nothing short of NT will cut it. Those other OSes don't
   offer anything to offset their inherent unreliability.

Action games degrade if they don't get 100% CPU attention, and the protocol
stack running to download your file does need some CPU attention itself.
It's not fair to expect this to be perfectly smooth. If you were running
Word etc you probably wouldn't notice the degradation.

That said, the degradation caused by PPP and TCP/IP at 28.8 while playing
games on my P120 is very slight.

    I've quite happily run Netscape with several downloads running while
    rebuilding my kernel and Wine at the same time...

It is handy sometimes - like when you're doing a long download.
That's the one thing I don't like about Linux - I can't play Civ2
while waiting for a download to complete.

Time to get on with cloning Civ2, methinks. :-)

Matt

Bullshit, JEDI, Bullshit. MacOS drives serial port servicing from
interrupt routines; I can detect no impact of a background modem
download on foreground tasks.

One of the earlier versions of Netscape I had (16 bit?) busy-looped
during downloads, but it wasn't even noticeable unless I had a cpu meter
running. I have 3.02 Gold now, and it uses near nil cpu for downloads.

I've never seen it cripple the machine; unless I see the download
Window, I don't even know it's happening.

grin Care to explain where did you get this 3.02 from?Netscape so
far shows 3.01 available.

Under Linux GCC is a native app, whereas under W95 I presume it's an extended DOS app. If it were ported to the Win32 console I think you'd see much better multi-tasking performance; the overheads of task-switching to/from DOS boxes are probably high.

At any rate, you would have to check that GCC was slowed down equally by Doom on both OSes to show that W95's task switching is poor. DOS boxes may simply get more than their fair share of the CPU under W95.

I read an article once about the results of various studies into the way a range of real users interact with their PCs. This was a major point of consensus among them. If if was purely my opinion you would see "IMHO" in front.

    That has nothing to do with it. Netscape is a greedy little bugger
    that acts like it's the only process in the system.

    This is fine for NT and 'nixes as they have the facilities to deal
    with such "malicious" programs.

Yes, the standard joysticks will work fine. Keep in mind that the Amiga's mouse -won't- work in the ST's mouse port without modification...

Hmm...I strongly feel that my Atari systems are just as useful today as when I first bought them. (and I'm still buying them!) I have a Mega 4 ST that runs my BBS, an STe that my son plays games on, as well as education programs (He adores Tony Barkers "Art For Kids"), a Jaguar for next generation gaming, a Lynx for gaming on the go, and (of course) my Falcon for my "serious" needs. <smile> I operate these systems at far less cost/system resource demands/and maintenance than anything the Wintel conglomeration (abomination!) can field.

>Because computers are about getting answers to problems, not about making
>political statements.

Exactly, and thats why I choose to follow the Fuji... Long may her banner wave! Oh, BTW, being able to make "political statements" at the same time as using my Atari's is just an added convenience...!   :^)

It installs fine but chokes when run (font problems methinks).

True. I have upgraded to a 200MMX and probably will make it a lot better. Another thing is that when win95 is using virtual memory, things get really bogs down. It is particularly true when I am running Magic the Gathering (not an action game). On my old machine (p100 with

16 meg), I have to close everything just to save on swapping time. Now
(P200mmx with 32 meg), I probably can multitask a bit.

>Goodwill staff going to be there? :-)

Don't laugh! I bought a working 1040STF with a few disks and color monitor for
$20 (half-price day) at the local Goodwill today. (Stat holiday - Victoria Day
in Canada)

A while back, one without monitor & disks was snapped up for $40, but this one had been lying around for at least 3 days. I thought I'd buy it before some kid stepped on the boot disk. It is, however, missing a mouse.

A while before that, I had the great good fortune of buying an Amiga 1000 for $40...so I now have some more antiques for my collection. I think I can use a standard Atari-style joystick in the mouse port (I have two I bought for my C-64) of the ST. The Amiga's mouse had no rubber ball - I used one from a (dead!) Mac ($15, another thrift shop).

My C-64, on the other hand, was a Christmas present, bought at full price when they were new. It served for several years as my computer; I wrote several programs for it, including some with machine language routines to speed them up. And I bought quite a few games for it as well. It eventually got relegated, once I bought an XT clone - whose motherboard got upgraded (right now, I'm using a Pentium Overdrive on a 486 motherboard...).

Back before there were IBM clones, I wanted to go to 16 bits without spending a fortune, so I considered something more independent. The Mac wasn't an option - it was expensive, and I was content without a GUI. It seemed that Apple was behaving just like IBM: charging premium prices for hardware because of the software available for it. So I considered the Atari ST, and even, later, the Amiga 500. The local Amiga group met out of town, so I joined the local Atari group for a year to learn about the computer...but I wound up buying my cheap XT clone. Today, the situation is different, in that hardware prices aren't the issue, but the Windows/Intel 386 architecture standard is just too strong. I plan to give my hard disk a housecleaning, so that I can again strike a modest blow for independence by reinstalling Linux on it...

but I just don't see any *reasonable* alternatives to Wintel. Alternatives I can recommend to my friends - and feel that I've been conscientious in respecting *their* interests, not just my opinions.

Because computers are about getting answers to problems, not about making political statements.

People interact this way (single-tasking) with computers because they either don't know any better or had they system crash in their faces when they tried it. Most people I know (who use systems with bad multitasking) belong to the latter group. They'd sure would like to do something else while a big download is on the way, while a big file is spooling to the printer, while installing a big program (especially older ones, on many floppies), but their Windows 3.1 systems won't allow it. It's a little better with Win95, but still vastly inferior to other systems such as OS/2, Linux and even NT.

I remember that beside having to reinstall too often, one of the main reason I switched to OS/2 from Windows 3.1 was that just starting Solitaire was enough to hang a 2400 bps download...

The problem I have with this statement is that, as a Mac user, I don't see *any* of my friends using their computers for anything substantially different than what I use my Mac for. I have an Amiga-user friend who's dropped about $1500 into LightWave and LightWave add-ons for his Amiga...but there's a Mac version of LightWave, which is quite zippy. And the Amiga is no longer, and hasn't been for some time, the premiere platform for running LightWave. And he's the only one of my friends who's doing different kinds of things with his computer, and these things aren't all that different from what I could do if I spent the same $$$.

For the most part, the Mac works better than a Wintel machine. I met someone at a party this weekend who heard from my girlfriend that I was a computer guru, so he came up and asked me how to get his CD-ROM to work. I asked him if it was a PC, and of course it was, so I explained that I really only work with Macs. His response to the word "Mac" was "The Mac sucks", and my thought at the time was that if he had a Mac, perhaps his CD-ROM would work. This apparently hadn't occurred to him, and I think the encounter highlights a problem the Mac has: there are many people who know very little about it, and more who are outright prejudiced against it. And despite the fact that many are confronted with inferior solutions, they still don't see them as inferior. Despite the fact that you can't get a CD-ROM to work, you still think you're superior to someone who never gave a second thought to a CD-ROM, because it worked from the start, and it continued to work. The PC users' solution is to buy a new computer. The Mac users' solution is to buy a CD-ROM and plug it in. This doesn't make me wonder about the fact that the installed base of Mac computers is much higher than the Mac % of new computers sold.

The main thing when you buy a computer is you should buy one that works the way you want it to that does what you want. As a Mac user for ten years, I've never called a technical support number, because I've always been able to figure out how to get things to work. Getting the machine to work for me, rather than the other way around, is high on my priority list, so it's understandable that I've been a Mac user for ten years. I've also never had problems finding the software that does what I need it to. And, once you get over the common pitfalls, it's a lot easier to program software to solve specialized problems for the Mac than most people realize. The fact that it's a GUI machine makes things a bit harder in some respects, because you have to spend a lot of time on interface details, but a lot of this code is cut&paste once you've built some working code and acquired the right resources. The fact that I can become reasonably proficient with Mac programming with nothing but a high school education in programming and a bachelor's in mathematics indicates, to me, that most people can write code to solve their own problems on a Mac with very little formal CS training. This is nice. The Mac *is* hard to program when starting out, but the learning curve is more friendly with some persistence.

> Because computers are about getting answers to problems, not about making

> political statements.

What problems do you need to solve that make you think the Mac is not a *reasonable* choice? For some people, it isn't. But for most people, it is. For some people, the Mac is clearly the best choice. Like everything else, there are strengths and weaknesses, but the Mac's weaknesses are surely not so severe that it is not a *reasonable* choice. Unless your friends want to multitask a full-screen realtime first-perspective game with complex Mathematica operations. If that's the case, the Mac isn't a good choice, but neither is anything else--except maybe an SGI, and those are too expensive to be playing games on (unless, of course, you're independently wealthy like some of my friends, and don't have anything better to do than buy cool stuff for the sake of having it and waste it because it's cool--it's nice to be independently wealthy; it just isn't a good representation of ordinary people). The Mac is a good choice if you want to run Mathematica. It is also a good choice if you want to play full-screen realtime first-perspective games; the Marathon Infinity demo impressed me enough that I will probably buy Marathon Infinity, and MacQuake is coming. DukeNukem 3D is out in demo. There are *excellent* graphics tools available for the Mac, in addition to excellent WP's, page-layout, etc. So-so spreadsheets. Excellent web development tools. Excellent internet tools. Excellent programming tools. Excellent scientific and symbolic math tools. Excellent multimedia. And in addition to all this excellent software, the hardware is very nice, and it works like it should; i.e. it doesn't take much brain power or time on the phone figuring out how to get things to work. How is this not a *reasonable* choice?

Too many people have bought into the media lines...everybody wants to read about David and Goliath, and you can buy that at the supermarket stand, and you can get it in Ziff-Davis magazines. These things thrive on tearing things down. The problem with the computer media is that there's only one thing left to tear down: Apple. And if Apple is gone, and Wintel dominates, there won't be any more David and Goliath. It'll be Goliath banging his head on the wall in a padded room. And how much fun is that?

It's so much fun, a lot of the people writing for the computer media would be out of jobs, and there wouldn't be very much interest. Apple is the last major company standing up to Windows and Intel. Think about that. I would also add, it is better than Windows and Intel, in most respects. Not in all. But it is certainly a *reasonable* choice. It is the last *reasonable* choice that can stand up to both.

There are much better solutions than Windows in many limited respects. But Apple is the last remaining company which satisfies the bill in most respects. I myself would prefer to see multiple (>1) solutions which satisfy the bill for "most respects". And guess what? We're down to 2. If one disappears, there won't be "multiple" anymore. And guess what? MS and Intel will get marginally richer. And consumers will get shafted. So, if you want MS and Intel to get richer, go for it. If you want to do cool stuff, it doesn't hurt to support/tolerate a little competition. If there is no competition, nobody will know that things could be better. And that's the problem. There has to be new stuff driving people to buy things. And a one-supplier economy isn't going to provide that. Things will still improve. But it will be like phones. In the old days, you had to rent a phone. You couldn't buy one. You had to pay exorbitant prices for long-distance. When AT&T was broken up, AT&T became a much more consumer-friendly company. Why? Competition is good. Deal with it.

What is failing in the computer industry has nothing to do with Apple--it has everything to do with consumer-friendly economics, and the fact that this "free" market is failing. The only thing which currently holds MS together is the fact that they can point to Apple as an example that competition exists. If Apple disappears, I suspect that there will be some anti-trust changes to artificially break things up. And which would you rather have? Real competition, or legally dictated, artificial competition?

This is not a political statement. The free market is superior. We should preserve it while it exists. Everything else is just intervention.

Actually, most PC users never have trouble with this kind of thing. Both my PC systems have perfectly functional CDs that I never give a thought to. There is a far larger installed base of PCs, with hundreds of manufacturers. Quality varies. From the Mac systems we have installed here, they seem more likely to fail than the PC systems. YMMV.

>The Mac users' solution is to buy a CD-ROM and plug it in. This

>computers is much higher than the Mac % of new computers sold.

The problem Apple (and other companies) is one of marketing. They flat out do not advertise to the mass market. Neither does Digital. This is their own (questionable) choice.

Competition is good. When I upgraded systems last Jan, I looked at all the

major platforms. I priced Dec, SGI and Wintel machines. I also contacted Apple via one of their email surveys. Instead of app lists (although most of the apps I use are no longer or never have been available for the Mac) and performance data they sent me a brochure telling me how warm and fuzzy people feel about their Macs and all the web browsing I can do with it. Not how much more work I can do with it.
Please.

Needless to say, I now have an NT4 P6 machine in my office. Works like a charm.

Which version of Netscape are you talking about? I've run Netscape 2
and Netscape 3 on my PowerMac, MacOS 7.1.2, 7.5.3, and 7.5.5, and
haven't seen the behavior you describe. You aren't making this up,
are you?

If by `hybrid' you mean `can run CISC and RISC code,' that's the
only one I'm aware of. On the other hand, more and more high-performance
CISC processors appear to have a RISC core. The Pentium Pro, for
example, takes the CISC instructions, translates them into `uops'
(u as in `micro') which have an instruction, two source and a
destination register, and feeds those into a RISC core.

I believe the NX did the same thing, but could also accept those
RISC instructions directly in the instruction stream.

<http://infopad.eecs.berkeley.edu/CIC/archive/cpu_history.html>
has interesting information on this sort of thing.

What if one user will want to do word-processing and another one play Quake?

>without disabling my fax and voicemail software, so the computer could keep
>on monitoring the phone as I played, or as it monitored e-mail and alerted

Get an operating system! My goodness, what the hell are you using? At best, Quake can use 100% of the cycles it is given. Except for the memory requirements, it's not all that different from running and endless loop.

No computer running a decent OS will become unusable when someone runs a single CPU hogger. You could run quake on a 386 Linux box, and still be able to use modems, networking and all that jazz. Sure, the game's framerate would be incredibly pathetic on such a machine, but that's not the point.
The point is that it's shocking that you have to disable your fax and voicemail software. Doesn't that strike you as odd?

On my computer at home, I could not only run a fax server and quake simultaneously, but they would execute on separate CPUs if they both needed the processor at the same time.

>me of any urgent messages, or downloaded files in the background, or
>compiled and linked a large project. Or whatever. Very soon probably most

So get an operating system. I can't believe that in 1997 someone with a powerful computer hardwarewise is wishing that he could play a little game while receiving a message or compiling a project.

Do you also not have running water or electricity in your house?

How can you stand using your computer?

>games will support multitasking in a window alongside other apps, and
>people will think nothing of using a game alongside another app, much as
>they think nothing now of full-screen, 30fps rendered 3D games.

I've been running multiplayer UNIX arcade games in a window along side other apps for years. Things like xtrek, xpilots and more recently Doom and Quake. The four people logged into this workstation don't even notice when a Quake is fired up.

As a test, I'm now going to edit a file in a FrameBuilder (bloated software!) window while two CPU intensive games side by side. Four people are logged in doing light editing and compiling tasks.

What do you know? The keyboard response is instantaneous. The game windows are smooth. Hey, this video card even supports different hardware colormaps for each window, so each game can manipulate all 256 color entries to its contentment!

This is an old workstation, about as fast as a Pentium 100 in some respects.

Did I mention that it's running an Informix database, and pretty hefty telecommunication management software?

Maybe you should wake up and smell the rotting net spam! :)

There is more to downloading than just an interrupt routine to dequeue data from a port. The data has to go somewhere.

Does the service routine also do the disk I/O transfers (which would be a crude hack, at best), or do you have to wait for a _voluntary_ context switch to the task which is performing the download?

What would happen if the download were taking place at 1mbps? How about 10mbps?

For a download at say 28.8 kbps, you only need a three to four kilobyte buffer, and the assurance that someone reliquishes the CPU in your favor once a second. No big deal.

However, what if some CPU intensive program holds up the processor for a few seconds? Does your download continue? How does the interrupt service routine obtain buffer space? Is it fixed or dynamically allocated? What happens when it overflows?

In an operating system, the arrival of data on the serial port may cause an immediate context switch to the process associated with that data stream, so that the process can remove the data from the operating system's buffers. Furthermore, in an OS with real-time support, you can give the process a high priority so that it's _guaranteed_ to get the CPU as soon as data is available from the serial driver.

Face it, MacOS is a kludge with a pretty face. No preemptive scheduling, no time slicing, kludged multiprocessing support, no globally scheduled threads. It's simply not a serious contender except for hobby / home uses and special purpose applications (e.g. public-access information browsing terminal or a server for providing a small number of services on a single network wire). The X terminal I'm using doesn't multitask either; it runs a monolithic X server: one task. It doesn't matter though because it is a special purpose hardware and software combination (``appliance'') that does its job well. I could easily replace it with a Mac running MacOS without loss of functionality, provided I could find stable, up-to-date X software for it. It would be a waste of a workstation, though.

>Time to get on with cloning Civ2, methinks. :-)

Perhaps you should word that differently: ``the one thing I don't like about
Civ2 is that there isn't a Linux port''. You can't blame Linux in this.

Quake runs; what's Civ2's excuse?

Those studies were flawed if they only considered how PC users interact with their operating systems. How else can they interact but in the prescribed ways? They are used to working around the limitations of the system.

If you asked a bunch of Kaypro or Osborne users about how they use their CP/M, you might be surprised to discover that users don't need task switching at all!

I made a mistake. That's where I got the 3.02 from. I must have been
thinking of IE's latest version/revision number. My Netscape is
actually 3.0.

Those are two names you don't hear very much anymore. I have two Kaypros sitting in my closet. A 93 II and a 94-2. Still work fine. Wordstar, Turbo Pascal, DbaseII etc. CPM 2.2G is probably the only bug free operating system in existence. AFAIK.

Jeff

Virtually all software I run under W95 is 32-bit, and it multitasks extremely well. DOS and 16-bit stuff can cause hiccups.

: :doesn't cut if for images because of the limited colors, and JPEG
: :doesn't cut it because it is lossy, so if you saved an image every
: :time you altered it, it would degrade.

: Isn't it JPEG's *compression* algorithm that's lossy?

: If you don't compress it, you shouldn't see losses.

Yes, but you *will* see a very large file - the whole point behind the use
of lossy compression in JPEG is that it gives you a very high level of
compression. If you're editing your own pictures, of course, then you just
have to keep an uncompressed (or losslessly compressed) copy lying around
and make the alterations to that each time. Otherwise you will see some
degradation every time you change it, though probably not as much as you
might think...

Why are you in an Amiga NewsGroup, if you are not advocating the Amiga, much
less why are you using a PO486, on advocate?

>Back before there were IBM clones, I wanted to go to 16 bits without spending

Not correct. you didn't really upgrade you machine, from my understand, clones
try to keep conpatablity with the old XT's and there for the processor is still
only 8bit, but that has change since the 486 I think. (IMO)

>but I just don't see any *reasonable* alternatives to Wintel. Alternatives I
>can recommend to my friends - and feel that I've been conscientious in
>respecting
>*their* interests, not just my opinions.

(IMHO)
Personally I don't like following the crowd, who knows where they'll end up, I live with 3 pc clones, not my own someone elses, and personally I've installed windows to the 486-dx100 about 30 times because of mafunctions in the software so that counts out 95 for me, NT/OSWarp I've never seen, MS-Dos is an basically a crippled version of something that AmigaDos pisses on from a great height, you don't have conclipping in ms-dos nor do you have the option of just typing the name of a dir and it cd'ing to it itself, you have to with out choice of yourself type 'cd thisdir' your limited to 8 chars and 3 extension, where as AmigaDos is not limited to this, if I want to make a file/dir with an incorrect chars to it on ms-dos I can't on the Amiga I can, in retrospect you can get interesting play toys for ms-dos that inharce it --to a degree-- but even those are pritty out dated compeared to AmigaDos.

Let's not forget while pc's just beeps we had stereo sound.

That's likely true, thinking about it - small changes, especially if they are not sharp features (or came from "similar" pictures), would be likely to result in DCT coefficients having about the same spatial frequency cutoffs. So little information would be lost...

When I was writing the book on Photoshop I took one of the images
included with Photoshop, JPEGed it, and then re-opened it alongside
the original. I examined it at multiple magnifications and could find
a few differences, but not enough to make it clear which was the
original and which was the JPEG.

I seem to remember that it was the middle setting for compression.
It's just possible that althought the image wasn't in JPEG format, it
may have been JPEGed at some stage of its career. Maybe I should try
one of the Kai's Power Photos.

David.

Actually, it appears to be that even when a interrupt service routine is finished, the CPU remains executing within the operating system and it is the OS that returns the CPU to the application. It would also pretty much answer the points below because once the interrupt is made, the CPU must complete the entire task that includes moving the data from the serial buffer to where it needs to do. The interrupt would have ensured the top priority context switching. It is only when the OS is done when everything is returned to the application. Everything is still done in the context of cooperative multitasking.

I have uploaded and downloaded large amounts of data under CMT enviroments, for both Mac, Windows 3.1 and Novell Netware 3.12.

CMT poses a lot of problems when it comes to multitasking, but
downloading isn't one of them.

Try subtracting the jpeg from the original (in such a manner that the difference between 2 identical images is grey 128), and then doing a histogram EQ. That will give you an exaggerated view of the differences.

The artifacts will elude many types of processing, but they get emphasized pretty quickly with some others. Some of the effects I've created with filter factory have turned very nice looking jpegs into 8x8 tiles with sinusoidal eye candy in them.

Actually, the answer is quite simple. WM_PAINT message recieve very low priority in a Win32 system. This means that the system will only paint when there is nothing else to do. Obviously there was something else to do. This can be changed of course in NT by setting foreground apps to have higher priority. In 95, however disk intensive activities do cause slower multi-tasking performance.

Hello Atari fans,

-I'm here letting you know about the Atari Preservation Society. The APS is a group of Atari fans trying to keep the Atari Experience alive into the next millinium!

-The APS has only been around for about four months and already has 200+ members, including Telegames, a Jag/Lynx game developer! We are looking for more members, so we can try to influence JTS!

-If you'd like to find out more about the APS, or become a member, make sure to visit the Official web site at:
http://www.geocities.com/SiliconValley/Vista/1863/main.html

Thanks for your time,

Megabyte,
Official APS Member!

-The Atari Preservation Society; We're Keeping The Atari Experience Alive!

That depends on your disk and controller. On 486 machines with older IDE controllers, full throttle disk access (usually about 2.5 megs/sec max) took 100% cpu. On my cheap 430FX pentium board, my main drive gets almost 8 megs/sec with about 40% cpu utilization. It is pretty rare that screen updates are late, even with disk activities going full throttle.

I'm sure games will find uses for all that spare CPU time - for example, monster intelligence has nothing to do with 3D accelerators.

How is this dumping? It is a product designed to run on a totally
different platform.
Oracle and their ilk enjoy the most healthy of profit margins in the
computer industry.
If it had been *any* other company other than Microsoft that was
offering the same
product at the same price, then you would not call it dumping. Unix
vendors like Sun
are still living in the past when they commanded high prices from
government agencies and

big companies. Now that the natural evolution of the computer industry has made hardware so much cheaper, those guys are running scared trying to figure out where they can inflate profit margins. Trust me: Scott McNealy and Larry Ellison are not out to topple Bill Gates and Microsoft to do any of us a favor. They fully intend and expect to become the next monopoly. Don't believe me? Go read todays San Jose Mercury News story on Oracle at http://www.sjmercury.com. Pay attention to how Oracle has a plan to be the one-stop-computer-shop (from high end servers to home users).

>
> When will Mircosoft learn how to play fair? Gates and co. are merely a

Microsoft plays as fair as any other company. In fact, their licensing is alot more equitable to cloners than, say, Crapple's, er, Apple's. In fact, Apple cloners like UMAX and PowerComputing are contemplating getting into the PC market because Crapple is so wishy-washy towards the cloners. When Crhapsody comes out, it is only going to be worse for the Mac-cloners.

>
> At this point, I wish Microsoft's people would cash in their stock and

My first computer was a Mac 128. I used Macs for a very long time until NeXTStep became affordable for Intel. I used NeXTStep for awhile along with Ultrix, Solaris, and IRIX. After a brief stint with the BeOS, I recently began using WindowsNT (with 3.51). Now, I think I am about as an objective person to say this: "WindowsNT does not suck as bad as you say it does." Let me repeat that: "WindowsNT does not suck as bad as you say it does." On a Pentium 133 with 32MB RAM and 512KB cache, my machine is as responsive as anything for normal tasks (for largescale 3D tasks, it slows only because my video card is an ancient Diamond Stealth with 2MB of memory). I can get LaTeX, anything related to the WWW, very nice development environments (NeXTStep was better), etc. Microsoft does make decent operating systems.

John

That's odd. Shouldn't such a task become blocked and thereby allow other (lower priority) tasks to get time? Or, is this still processor assisted transfer? I suspect that the affect would be much less noticable with bus mastering (I thing you call it... when there are separate chips to handle the informatin transfer rather than have the processor deal with it).

This depends on the design of the hard disk controller.

Most clones have bus-mastering capabilities on their IDE controllers,
however most people do not install the drivers and thus default to
programmed I/O.

Running full tilt on my machine with DMA busmastering enabled, my IDE
subsystem consumes no more than about 5-10% of the CPU's attention. This
is a P100.

Bus-mastering SCSI obviously has even better performance characteristics.

Yes, the task is blocked while waiting for IO, but unfortunately the OS is
also waiting for IO so it can swap pages in to the system.

Indeed. I couldn't agree more, especially as I said excatly this a few weeks ago (probably in the same thread, judging by the length of time this one's been going). Having smaller programs also helps you keep the memory of your machine in control. If you have huge sprawling programs that try to do everything at once and do it before you've even thought about it (and usually getting it wrong) then your memory goes in large chunks whereas if you have small programs that are more 'dedicated' then you can load them, do your operation, and if you know you won't need them again then just quit them straight away. Easy. Hell, if you DO need them again then just load them again - it'll only take a few seconds!

Loading something like PhotoDesk or PhotoShop just to make a little red
circle or loading Impression or Word 8 to create a quick note to stick
on your monitor is overkill.

Mit.

In the case of Impression, overkill.

In the case of Word 8, over-over-over-overkill. _How_ much memory does
it use?

Say what? IDE DMA is a relatively new thing. Not all motherboard types have it.
Wasn't it introduced on the Triton II? Perhaps most _new_ clones have it.

The ASUS dual pentium motherboard I bought over a year ago certianly doesn't
have DMA for IDE drives.

The first time I checked it out I thought the same thing. However, I will say it does have potential. Although, I don't think this is the appropriate newsgroup to be posting to.

There should be some way in modern operating systems to limit the amount of memory a program can access, so that one misbehaving program won't be able to take up all your memory. It will be like setting the priority in a preemptive multitasking environment. The applications should have settings for the minimum and maximum amount of memory they need, and the user should be able to adjust the maximum value manually. This shouldn't be left to the programmer of the application. Modern operating systems should not crash from a misbehaving

application. If applications have a maximum memory partition, then
when the application needs more memory, it should ask the user for it
or in the worst case just crash, without affecting other applications.
The MacOS has this, so an application cannot take the whole memory.
Other applications running always have their maximum amount of memory
available. It used to be wasteful in the past, but now memory is
cheap.

You dork, it is suppose to rhyme. If you are going to bash Atari users then
learn to cite a rythm correctly, or at least put capital letters and the
correct puntuation where it belongs.

I agree with Casper. I also say that this is probably the wrong
newsgroup to be posting to. I thought it was an AS/400 related site -
what a let down.

MacOS does this by using fixed addressing for application memory spaces.
The stack starts at address 0xso-and-so, and the heap starts at address
0xthus-and-such, and they grow toward each other.

If the stack overflows into the heap, it's crash city. But, by god, the
application won't take more than its fair share of RAM on the way down.
;)

: Say what? IDE DMA is a relatively new thing. Not all motherboard types have it.
: Wasn't it introduced on the Triton II? Perhaps most _new_ clones have it.

Actually, I think it was with Triton I.

: The ASUS dual pentium motherboard I bought over a year ago certianly doesn't
: have DMA for IDE drives.

The dual P5 chipset is, I believe Neptune--which doesn't support IDE

DMA.

I don't think any of the Tritons support dual P5 systems (although,
the newest ones may).

For Unices there is system call setrlimit() for adjusting maximum usage of system resources. There are two flavours of these limits: hard and soft. Soft limits can be set only within range of hard ones and hard limits can only be lowered (to increase, application must be run in priviledged mode). Many shells have 'limit' or 'ulimit' builtins around the function (at least bash and tcsh) and these limits are inherited by child processes.

However, the only way to set these limits is to inherit or set them by application itself. And in the second case there is a little sense to do it interactively: if application is samrt enogh to watch out it's limits, it usually is smart enough not to exceed them (btw, how could you expect daemon running in background asking if would you be so kind and spare it some extra memory? who should be asked?),

But another matter is if program will behave correctly after failed attempt to exceed limit (e.g. trying to allocate more memory). I've seen many 'Virtual memory exhausted'-like messages so I'm not so optimistic.

> Modern operating systems should not crash from a misbehaving
> application.

Only 'system crash' I happened to have under Linux was console's keyboard/screen lock and I believe I wouldn't have to reboot machine if I had an extra terminal plugged to my box. IMHO, isolating applicatons from itselves and the OS is standard, not The Holy Grail.

> but now memory is
> cheap.

It's true but don't rely to strong on it. Memory hogs are always annoying, no matter how much memory do you have.

There is; it's called adjusting the working set. A more crude adjustment is to
simply say ``you have this much virtual memory to play in, and no more''.
Easily done with process limits in Linux. You can set how much memory a program
can have, how deep its stack can be, how long the program can run for, how big
of a core file it can generate, how big a file it can create, etc.

They could have at least used the correct spelling for St. Louis
(instead of St. Luis). They were referring to the city in Missouri (I
saw the picture of the Gateway Arch), not some other person/place/thing.

Casper, your opinion, shall we say, is generous compared to mine. I'll
leave it at that.

No Atari, Apple, Commodore, DEC, Handheld, HP, etc. stuff (actually not any computer stuff) to be found there what so ever, just a bunch of pictures of 'the outside' (augh! the light, no computers! no net! I'm melting....)

The buttons were hard to understand I assumed incorrectly uou click on the blue thingis below the names to go to different pages, wrong. Also takes forever to view if you have a 14.4k modem.

Post back here to us when you get some good computer shots, ok.

The Triton 430HX chipset does support dual Pentiums.

The Triton HX chipsets are also available since last year, and they do support IDE DMA, though not the latest DMA-33 kind the 430TX supports.

This was introduced with the Triton 430FX chipset.

I am reading something similar with the IDE drivers of Warp v4 running
on a motherboard with the Triton HX chipset. Remember, these drivers
are installed in default by Warp v4.

Netscape Navigator Gold on a Performa 475 seems to be rather selfish when
it comes to processor power. Yes, it's a very underpowered machine, but
I've seen browsers on less powerful platforms that do a better job...

All I know is for over 2 year now IDE DMA was available on low end
motherboard. I gather that from my pre win95 system that suport busmaster
dma. The triton FX (1) had that feature.

 A few dual p5 mb are tritons2 based...

What I don't like about Mac memory usage is that after applications take their preferred memory size, the applications continue to hold onto unused memory which other programs can't use. So if I run Photoshop with a 50 MB preferred memory size just to view a 100K GIF file, Photoshop will still hold onto the entire 50 MB even though it is actually using only 10 or so megs. Do you acknowledge that this is a problem? I suppose you might tell me that is so easy to adjust Photoshop's memory usage to just 10 MB. But ease should not be confused with convenience or practicality. My point is that I should not have to constantly consider and set how much memory I intend to use each time before running an application just so I don't end up wasting dozens of megabytes.

Sure, it's nice to be able to limit Netscape's memory hogging. But instead of applauding the Mac's memory setting ability, shouldn't we also point a finger at Netscape for hogging the memory in the first place?

In addition to being able to set maximum memory usage for applications, all Mac programs should release memory they are not using, instead of holding onto fixed partitions of wasted space. There should also be a default "Unlimited" mode which lets software automatically take as much memory as they need (and give back what it's not using, as it should always do).

Unix: use the 'ulimit' command in your preferred shell.

Linux resource limits:

```
       RLIMIT_CPU     /* CPU time in seconds */
       RLIMIT_FSIZE   /* Maximum filesize */
       RLIMIT_DATA    /* max data size */
       RLIMIT_STACK   /* max stack size */
       RLIMIT_CORE    /* max core file size */
       RLIMIT_RSS     /* max resident set size */
       RLIMIT_NPROC   /* max number of processes */
       RLIMIT_NOFILE  /* max number of open files */
       RLIMIT_MEMLOCK /* max locked-in-memory address space*/
```

> On the Mac, the programmer _suggests_ values, but the user can
> override. On Unix, you need to be a programmer to understand what the
> limits are, let alone to set them.

On Unix, the programmer mallocs and lets the OS worry about allocation.
The user can impose upper limits, if he or she so desires.

I can understand why it's sometimes preferable to impose an upper bound
for memory and file usage, but why on earth would one need to impose a
lower bound? "Hey, the program doesn't need the excess, but I INSIST ON
WASTING IT !!??"

That minimum & preferred memory usage thing is more an indication of
limitations in the MacOS memory management, and it isn't anything like
the ulimit command in Unix shells.

> With memory cheap and the improvements in the Mac's virtual memory

> system, ease of configuring memory usage is _almost_ an advantage to

I don't think needing to block out a contiguous memory space on program start-up is an advantage; in fact it would be sad and lame if one still has to do so even though the underlying kernel has an efficient VM that doesn't require such things. I mean, that would be taking a real deficit making it into a virtual deficit...

> How does this work on Win95/NT?

File limits, 3rd party. Memory limits, dunno. But why would you need to set a minimum contiguous block of memory in those thingies?

It isn't a problem if you are using a decent VM scheme -- I use RamDoubler 1, but I hear that 7.6, maybe even 7.5.5 is acceptable. My powerMac has 24 Megs of real RAM, and RamDoubler tells MacOS that it has 48 Megs. Were I to open up Photoship with a preferred memory size of 30 Megs, and then open up a 100K GIF file, most of that 30 Megs of RAM that photoshop thinks it has are virtual -- with RamDoubler, they're nowhere until PhotoShop actually uses them for something.

If you are running a reasonable VM implementation, those "wasted megabytes" are virtual, not real.

You don't understand virtual memory, do you? Learn about it. There are well-known mechanisms to provide the benefits you desire, without a lot of the side-effects and complications your scheme would also generate.

|> There should also be a default "Unlimited" mode which lets software

Unix programs don't work this way. Mac programs don't work this way.
Do windows programs work this way?

And Adobe rep recently visited Capitol Macintosh (Austin's Mac User Group) and told us that their products do their own memory management...essentially their own VM. I didn't think to ask what they do on a Windows system.

I believe there is a great deal of room for improvement in Mac's memory management and I'm curious to see what's planned for Rhapsody in that department.

Regards,

Jay

I get 6 megs/sec on my 430FX motherboard with a 2 gig Maxtor, and 7 and
8 megs/sec respectively with my 3.1 and 4.0G WD Caviars. Maximum cpu
usage is about 40%.

On the other hand, if you allow a program a huge stack, it should not necessarily chew up physical memory unless it's actually used. On the Amiga (and minux and others) you had to be careful to select an appropriate stack size - too small, and your program may crash, too large, and you waste memory.

With VM systems, its easier to allow a huge stack, yet no memory needs to be committed if it's not used. Usually, it's easier to put a limit on total memory used, rather than just the stack.

Linux supports more limits than these two, see below.

>On the MacOS, you click on the application's Icon, choose "get info",
>and set it's minimum and preferred memory usage.
>
>Which one's easier?

That you can even compare the Mac's abomination with UNIX process limits
indicates extreme cluelessness.

For one thing, process limits are associated with *instances* of processes, not
the executable files themselves. One instance of the same program can run with
different limits from another instance. In MacOS, you can't even run multiple
instances of the same program, the last time I checked, not to mention
run multiple instances on behalf of different user. Is it therefore surprising
if the user interface for setting the limits is ``easier''?

Secondly, you don't set aside fixed-sized partitions for a process in UNIX.
With the Mac, the user _has_ to know about ``Get Info'' and fiddle with it.
UNIX users don't need to be aware of process limits; it's more of a security
feature than anything else. I couldn't care less how much memory is needed by
my Vim editor, the ``grep'' program, Netscape or Wordperfect. Why should a user
have to know what kilobytes are or how much of them a program needs? Why

should a user have to open and close applications in a certain order to reclaim memory? Why should a user have to get a message like ``there is not enough memory to complete the operation'' even though there clearly _is_ enough memory, and then have to close the program, adjust the Info and try again?

Incidentally, in Linux you can control a rich variety of settings with bash's ulimit command:

```
linux:~>help ulimit
ulimit: ulimit [-SHacdfmstpnuv [limit]]
    Ulimit provides control over the resources available to processes
    started by the shell, on systems that allow such control.  If an
    option is given, it is interpreted as follows:

        -S      use the `soft' resource limit
        -H      use the `hard' resource limit
        -a      all current limits are reported
        -c      the maximum size of core files created
        -d      the maximum size of a process's data segment
        -m      the maximum resident set size
        -s      the maximum stack size
        -t      the maximum amount of cpu time in seconds
        -f      the maximum size of files created by the shell
        -p      the pipe buffer size
        -n      the maximum number of open file descriptors
        -u      the maximum number of user processes
        -v      the size of virtual memory

    If LIMIT is given, it is the new value of the specified resource.
    Otherwise, the current value of the specified resource is printed.
    If no option is given, then -f is assumed.  Values are in 1k
    increments, except for -t, which is in seconds, -p, which is in
    increments of 512 bytes, and -u, which is an unscaled number of
    processes.

linux:~>ulimit -a
core file size (blocks)  10000
data seg size (kbytes)   unlimited
file size (blocks)       unlimited
max memory size (kbytes) unlimited
stack size (kbytes)      8192
cpu time (seconds)       unlimited
max user processes       256
pipe size (512 bytes)    8
open files               256
virtual memory (kbytes)  2105343
```

The difference betwen a hard and soft limit is that a hard limit is absolute and can only be adjusted downward, but a soft limit can be adjusted up and down, within the confines of the hard limit.

The sysadmin can easy set the limits by dropping a suitable ulimit command into /etc/profile, such as:

```
    ulimit -HS -c 4096 -d 2048 -s 2048 -u 5
```

allowing the user 4 meg core files, 2 megs of data space in a program,
a stack size of 2 megs and no more than five concurrent processes.

The limit on number of processes has the curious and useful property in that all of the user's processes are counted against the limit, but each process has its own independent limit that is tested when it tries to fork. Thus the limit is good for system security as well as for confining a particular application.

It's a problem, and the kludges are not a real solution. Apple has finally woken up and commited to a plan for relegating MacOS to the trash can where it belongs, while continuing to protect the investment in MacOS applications. This is a smart move.

There is still only one address space, though. What if some program claims most of the global virtual address space? Even if none of it is mapped, you are screwed.

Contrary to popular belief, virtual memory is not entirely free. If you don't have separate virtual address spaces, then the single virtual address space becomes a shared commodity. And even if you have separate spaces, virtual memory has to be backed by swap space. Otherwise you have an ``overcommitted'' situation in which a process is falsely led to believe that it has been granted more memory than it can actually used, and the system may not be able to supply actual pages for the entire allocated region before its swap and core is exhausted.

In other words, you can't magically create RAM by pushing out unused stuff into your swap space. Eventually your swap will fill up too, and then what do you do?

Either Ramdoubler can detect that a piece of memory is truly no longer in use and completely remove it from the virtual address space, or it can only remove it from RAM, but save a copy in swap so that it can be recalled should the program need it again. (I suppose that it could also make special provisions for memory containing all zero bytes.) I would be surprised if a cleverly written program wasn't able to defeat such schemes by using its heap space in unconventional ways. You can't look at a piece of memory and know whether it is in use without making assumptions about how memory is internally managed by the program. Thus you can never know whether it's safe to meddle in that program's affairs by removing that memory. Sure, if the memory contains all zeros, you can always recreate it on demand, as a special case hack. But what if it does not?

Is it not true that Ramdoubler depends on the good behavior on the
part of an application? (Like what doesn't, under MacOS).

Maybe he understands the way virtual memory _should_ work in a properly
designed system. Apple Inc is starting to understand virtual memory. Hence the
plan to phase out the MacOS kludge.

>Do windows programs work this way?

UNIX programs *can* work this way. It depends on how your application
was written. When a UNIX process unmaps memory mapped regions or adjusts its
``break address'' downward, it is really giving back virtual memory to the
system such that it is available for whatever purpose the operating system sees
fit. The released pages can, for instance, be assigned to an arbitrary place
in another process' address space.

Good allocator libraries take advantage of this capability. It's more of a
programming language or library issue than an OS issue. If you write a
heap-compacting storage allocator in UNIX, you can give it such behavior that
it will minimize memory usage. The heap-compacting allocators in the Mac's
toolkit can't actually give back memory to the system, only to the
application's partition.

This discussion seems to be focused on virtual memory systems that have lots of paging going on. From what I understand, in a nutshell, native PowerPC software with System 7.5.5 and 7.6 can do more extensive paging of application code to the disk so the apps can use less physical RAM. But how does this address the fact that applications still reserve large fixed chunks of physical RAM, neither taking more physical RAM when needed nor releasing physical RAM that is not being used? Even when an application is paging to disk, doesn't it still hold onto unused physical RAM in its "Preferred" memory setting? Isn't this the same as when virtual memory is turned off?

In contrast, consider what RAM Charger does for the Mac. RAM Charger is made by Syncronys (see the web site and related articles at www.syncronys.com/ramcharger/). This is what happens when you turn off virtual memory and set RAM Charger to open applications in a very small inititial RAM space and access all available physical RAM. Of course, not all Mac programs will behave ideally with RAM Charger due to the vastly different memory usage schemes. When you look at the "About this Macintosh" box, you'll see that application's memory partitions are a lot smaller and there is very little unused RAM in the partitions. Now, do something that will make an application exceed its current memory usage, such as opening lots of large files. Looking at "About this Macintosh" you'll see that one of two things:

1) The application increases its memory partition by only the amount of RAM necessary at the moment so the partition contains very little unused physical RAM, or

2) The application takes physical RAM from the System heap so the System Software appears to be increasing its RAM usage.

Now close all those large files and you'll see that either the application's "preferred" memory partition or the System Software paritition has gotten smaller, again with little unused space in the partitions. I'm probably not doing a good job of describing it so I'll just quote from the RAM Charger FAQ:

"What is RAM Charger?
RAM Charger is powerful, install-it-and-forget-it performance software for your Macintosh. Your Mac OS does not manage RAM as efficiently as it could. The Mac OS grabs and reserves RAM in fixed blocks for each program you open. Unneeded RAM is not released and additional RAM is not taken. As

a result, free RAM is not delivered to where it's really needed, and you often hit the all-too-familiar 'Out of Memory'. RAM Charger adds dynamic RAM management to your Mac OS. Programs launch within smaller blocks of RAM which automatically resize as you open, revise, and close files and programs."

"Dynamic RAM management - what will this do for me?
This means that you can run more programs, run larger programs without constantly changing their "preferred" sizes, and make your Mac OS more stable and reliable. In more detail, a RAM Charged program will only have allocated to it the amount of RAM nearly equal to what it currently needs. If the program requests more RAM within what it thinks is it's fixed memory block, RAM Charger is able to add the requested amount to what is allocated to the application, from the total pool of unused memory. That means each RAM Charged program has access to all the RAM available, not just what is allocated to it in the initial block by your operating system."

Syncronys notes that RAM Charger is not necessary for Windows because Windows (and Unix?) already operate in this manner. So should MacOS.

Additionally, stack area and memory usage have very little to do with each other. The stack is used for local variables of functions, essentially. If you have recursive functions or functions that declare large arrays as local variables, you need a lot of stack. Given that the stack has to be continuous to work, a system that doesn't use the MMU has to set aside the largest allowed space right away, and if that space isn't large enough, well, tough. If you are lucky, it might get caught --- if not, the stack will just overwrite something else in memory.

The amount of memory a program uses, however, is normally dominated by the dynamically allocated memory, which does _not_ come from the stack, but from what used to be called the heap --- although that term seems to have been dropped with the advent of multitasking. This is the sort of memory malloc() will give you.

>With VM systems, its easier to allow a huge stack, yet no memory needs to
>be committed if it's not used. Usually, it's easier to put a limit on
>total memory used, rather than just the stack.

Exactly. A VM system can pretend that each process has a flat address space all for itself; The old single-tasking model of stack and heap, one growing from the top and the other from the bottom, can be applied again; Of course, physical memory only gets committed when a new logical page is actually used.

In such a system, it is extremely easy for the OS to keep track how many pages it has committed to a certain process, and to refuse any further pages when the limit has been reached.

Since Pong was the game from which gaming sprung I was pretty psyched when I came across an incredible version of Pong. Called VRML Pong, it's at http://vrml.sgi.com in the gallery section index. VRML (virtual reality modeling language) allows for a 3D Web that can be navigated which means that I could literally immerse myself in Pong (: Not such a bad thing.

PLEASE NOTE: LinuxWare.com is a Linux Support, Information, and general purpose Linuxer Hangout Site. We are setting up LinuxWare.com to be a meeting place for people interested in learning more about Linux, providing help to other Linuxers, and promoting Linux!!!

To facilitate this, for starters we have setup a local Linux Support mailing list for our members , an online Linux support forum, online Linux Books, and more. We would like this site to become a sort of "On-Line Linux Users Group", any suggestions are more than welcome!

Members of LinuxWare.com can use these services to get Linux support and also help out other Linuxers. This is what using Linux is all about!!! :) Everyone here is encouraged to participate as it is the main purpose for running this site! Please help out your fellow Linuxers!!!

Also, full shell access is available so people who have never tried Linux from the shell prompt can give it a shot. Also, shell access is provided so people can see how this site is setup. Use of the gcc compiler is also available apon request.

As you can see from the above, the use of this site is clearly restricted to supporting Linuxers and promoting Linux!!!

Here's a summary of what's currently available!

*Internet e-mail
*FTP
*Full Shell Access
*Linux Support
*Telnet
*UseNet
*World Wide Web
*GCC
*Local Mailing List
*Web Space
*Internet Relay Chat
*and more!!!

If you don't see something you like, just ask!!!

For more information on obtaining an account, please goto
http://www.linuxware.com

Enjoy!

Peter Lazecky

When comparing RISC and CISC, why don't you use a real CISC processor?
It was told, that the NS32032 architecture had the smalest code size
among the available processors that time. The benefit of these real
CISC processors is, that assembly language programming is like C
programming. The functionality available is almost the same. :-)

SCO does own the AT&T Unix source code, although others have source and OEM licenses... because they purchased it from Novell, who had purchased it from AT&T...

Rights to the Unix name, however, are now assigned to an entirely different entity!

E-Mail Your Way To Riches!

Dear Friend,

We all know E-mail is here to stay. It's fun, easy and exciting! Would you be interested if we could show you a way to make well over $1,000 per week doing it?

This is not a joke. You may have seen many people trying to tell you that you can make money by joining this or that scheme! Guess what, you decide to go for it and then you get nothing but frustration and disappointment! We are here to take your frustration and disappointment into an Electrifying Adventure!

We have been marketing on-line for almost 2 years now! We have never spent one red penny on advertising and made nothing but profits. We can show you how to make money every day of the year. Many people may think this is untrue or it just can't be done. We are here to tell you that it is absolutely not true. The biggest mistake people make about marketing on-line is that they sit and wait for people to contact them. You will never make it if this is your approach and we'll tell you why. There are over 60 MILLION people on-line right now, and seven new people logging on every minute of the day world-wide and everyone is offering something. So how do you get a potential client or a new customer before your competition does? The answer is simply " Creative E-mailing" and it WORKS! I'll tell you why. You're taking your product, service or idea directly to the market instead of waiting for the market to come to you!

Here are a few testimonials we'd like to share with you (They're all 100% TRUE!):

Internet Communications, my wife and I owe you so much. We ordered your Creative E-mail System and within the first week we received over $1,150 in orders for my Internet Consulting business!
--Charles -- California

I have bought two so-called E-mail programs that cost me over $600.00 when I received them. They were extremely difficult to operate and it took me about two weeks to figure them out. Once I did, they were so time consuming it just wasn't worth my time. When I received your course it took me about four minutes to install and I was in business! Within the first 24 hours of my first E-mailing I received over $580.00 in sales over the phone. That first week I grossed over $2,000.00! I really can't believe how easy you made this, anyone can do it! Thanks!
--Dennis -- Illinios

Hello, I'm a divorced mother of two children. I wanted to thank you for helping me out. This was my first time buying anything on the Internet. I was skeptical at first but I figured I'd take a chance. This was the best chance I've ever took! My part-time business is now a full-time home-business, thanks to your Creative E-mail System. I had to hire my two family members to help me out! This is GREAT, thanks so much! I'd recommend this for anyone!
--Ellen -- Florida

You may have seen other people offering products "E-mail Programs, E-mail Addresses, Extractors, Etc." The vast majority of these products are very over-priced and very difficult to even use. None of them even supply you with current, up-to-date, FRESH & RESPONSIVE E-mail addresses! Our Creative E-mail System puts everything into one package to make your profits soar immediately! Even if you do not have a product or service to offer, we are going to give you over 500 how-to reports that you will have full reprint rights to! What makes our course different from anything else being offered anywhere is that we're dedicated to your success! We do not succeed unless you succeed! All of our E-mail Address Databases are created in house. We do not trade our databases with anyone because people are selling extremely bad lists on the Internet. Many of other people's databases are filled with duplicate addresses and many of them are undeliverable. We keep our own database so we know exactly what we have and we keep nothing but the best. There's no other way. We believe in producing high quality products that should be priced reasonably for your success! Read on to see the special bonuses you will receive.

******** SPECIAL 10 DAY BONUS ********

If you order within the next 10 days we will include:

1) 500 How-To Reports (You may resell these at any price)

2) Your Personal Complete Guide To The Internet -- This 175 page e-book covers

every single aspect of the internet. You will never have to buy another internet book! When you complete this book, you will know more about the internet than 90% of the people online right now.

3) When you purchase our 8 MILLION SUPER responsive E-mail list we will include Mega-Mailer. It sends 250,000 E-mails per hour! All other orders will receive Pegasus Mail. It mails about 30,000 per hour.

Here's how to get the Creative E-Mail System:

All orders are delivered on CD-ROM or 100mb Zip Disk (Iomega).

============> E-Mail Databases <================

2 Million FRESH E-mail Addresses only $ 99.95
4 Million FRESH E-mail Addresses only $179.95
6 Million FRESH E-mail Addresses only $249.95
8 Million FRESH E-mail Addresses only $299.95

You will be sending your Marketing Letter to 2, 4, 6 or 8 MILLION People! To mail to 2 MILLION People by U.S. Mail at $.32 per stamp would cost $640,000.00, not including envelopes or paper! The price of 2 MILLION E-mail Addresses isn't even a fraction of the cost. And the great thing is that if you have 10 products, you can E-mail to your list as many times as you want to! Your profits will never stop soaring! Don't pay someone else to send your advertisement out, do it yourself and save big money! The average cost right now to send your ad one time to ONE MILLION people is $1,400.00. You can send it 100 times to EIGHT MILLION people for only $299.95 and that includes Mega-Mailer that sends 250,000 per hour!

===============> Order Form <===============

Yes, Internet Communications Inc., I wish to take you up on your SPECIAL 10 DAY OFFER FOR YOUR CREATIVE E-MAIL SYSTEM, INCLUDING THE TWO SPECIAL BONUSES: "Complete Internet Guide Book" and "500 How-To-Reports". I understand I have to completely fill out the order form so you can fulfill my order.

: the solution for future would be sonud output of active window,
: maybe faded in, and still some priority levels to let the beep
: of another program working get through.

When I was working on the game PowerCrystal (large scale adventure game in 3D for Win95 and the not yet released M2 console (http://thor.lib.chalmers.se/~jamest/power_crystal for anyone interested)) we used DirectX on the windows side which you could set up to do exactly that.

It seemed to be a nice system at first, but after a while I found it to be a bit hard to work with as it seems to be aimed a bit too much towards the C++ people which is not really what we wanted as we where coding the game in C.

I had it running together with a couple of other games and it switched the sound between them as input focus changed. One of the other games I ha drunning at the same time (to really load the machine when testing) was the Creatures game (http://cyberlife.co.uk) and it did work quite nice even though it sometimes reported the hardware terribly wrong and did some very time consuming stuff if you wherent very careful about how you handeled it.

The idea was very nice though, I hope it will develop in the future.

You want complex? Check out the VAX's instruction set sometime. printf() in microcode, no less.

The point of RISC is that the vast bulk of code is generated by compilers, which didn't (at the time RISC was new) use the tricky instructions much. So they were left out, the silicon got simpler and hence faster. RISC also traded some code size for standard instruction word length to make caching, pipelining and branch prediction simpler and hence faster.

I'm looking for a few volunteers/guests to be with me when I shoot in the SF Bay area for about 1-5 days in early June. Video experience a plus, but not vital. No need to commit for the whole shoot, you can just stop by if you like.

I'm essentially making this offer to allow some of the more ravenous Atari fans a chance to meet some of the most famous names in Atari history.

People like Al Alcorn, Joe Decuir, Warren Robinett, Doug Neubauer, Rob Fullop, and more. Mostly 2600-related, but some 8-bit talk.

I don't want to turn it into an outright convention, but I do think it would be nice to let some people meet their "idols" so to speak, and if you want to assist in the interviewing, I could use the help.

Please e-mail me if you want to attend and spread the word at your user group meetings...

Glenn Saunders

Who makes more $$ - Windows vs. Unix programmers?

Neither - it's Atari programmers that make the most money.

Hello

I am starting up a company in the Netherlands. We are distributor for many products in Europe and outside. We are looking for companies who want to become reseller of some of our products in there country.

We have products for every branche in our assortiment. Just mail me and we can discuss this further.

We are also looking for programmers since we are developing software ourselves, If you can program good please contact me and we can discuss this.

Sincerely

Ruben Daniels

I need Software developers who can program highly advanced graphic programs.
The Software needs to run on Unix Workstations and Windows NT/95 environment.

It is not a one person project. You will be working with multiple people.
So you have to know(or learn fast) how to work in a team.
It doesn't matter were you live. 'Cause we can have contact through the Internet.

If you think you can do this, PLease ReMail this message and tell me something about yourself and your work(not neccesary). And I will send you some more information.

Sincerely

Ruben Daniels

The CAD industry is a very delicate industry.
Everything has to be precies sometimes as precise as a 10th or 1/100 of a mm.
This is iin some case impossible to do with a computer cad program.

Companies that have these problems for instance people in the designing industry have to make everything perfect.
For them is it impossible and much to time costly to use a computer fo this purpose.

Well I have got the best thing for you.

It is an machine developed in Denmark.
There is still only one prototype of it.
It is a laser wich can scan any object and make it into a dxf format file.

Of course you can see that this machine has unlimited possiblities to use it.

We offer now, 'cause we still have to refine and test it, a free use of the machine.
The only thing you have to pay are the transportation of the object you want to scan to send to Denmark.

It has an accuracy of about 1/10 mm but if the machine is ajusted just right it cen be even more accurate.

In the future we expect it to be as accurate as 1/100 of a mm.

Of course the objects cannot be very large. If they are they must scanned in a couple of times.
Of course this is no problem.

It can save tens of thousands of dollars because else someone had to make it with the computer which is impossible to do with a precision of a 10th mm.

The speed of this machine is incredible of course you can control this but it can be done in 5 minutes. Of course the scan will be better if you let it take more time to scan.

Please remail this message for more information. Please tell me what kind of object you want to use it with etc. If you want to make use of the testing we will bring you in contact with the developer of the 3D laser.

When you remail lthis message please answer the following questions.

Thank you

- If this machine was brought to the market what would you be willing to pay for it?

$10.000 - $20.000
$20.000 - $30.000
$30.000 - $40.000
$40.000 - $50.000
Another value please type it yourself

- What would you use it for and what do you think it can be used for?

- Do you know people who could use this product? (Do you want us to contact them)

Sincerely

Ruben Daniels

Yep, folks, I've been a TOS user for well nigh ten years now, but it's finally time to sell the ol' Falcon (which was a fantastic machine for my media business from 1994 to 1996!)

So, I've decided to price it low so someone else can get as much fun and use out of it as I did.� The following is the listing of what I have for sale, and how much it will cost ya (note - add in the shipping fee and COD fee):

> One Atari Falcon 030 4/0 - Yep, this is the good ol' stock Falcy we all know and love.� It comes with keyboard, mouse, and all the other myriad ports and software that Atari included (GDOS, language disk, etc.), including MultiTOS and AtariWorks.� I'll also throw in Geneva, the fast multitasking environment with customizable appearance.� Most manuals are included, as are original disks.� If you REALLY have to have it, I can throw in the original box, too (though it would take longer to get to you that way).� Asking $400 OBO.
>
> One 500 megabyte hard disk with Falcon cable - it's got a ton of shareware, registered and unregistered, as well as HD-installed versions of the Geneva multitasking OS and AtariWorks (both of which I'll keep on there if you buy the computer, since you'd have the legal copies already.� Otherwise, they won't be on there).� In particular, there's a wonderful working Internet setup, with CAB, STiK, Newsie, MGFTP, and a number of other goodies, all waiting to

go!� And if you decide to go for the whole bundle, all the commercial apps below will be on it already (plug and go computing!)� Asking $150 OBO.

One copy of Calamus SL - the wonderful modular DTP package.� Includes all the base modules plus raster objects, vector objects, and a few extra fonts from a DMC upgrade deal.� Everything you need to do top-quality desktop publishing work.� All manuals and disks included.� Asking $75 OBO.

One copy of Envision Elite - a great bitmap editor, with lots of powerful functions.� Sort of a "mini-Photoshop," without the filter plug-ins, this program allows full editing in color and has a number of powerful brush and tool functions.� All manuals and disks included.� Asking $25 OBO.

One copy of Papyrus 3 - WOW!� What a WP!� This document processor includes EVERYTHING you need to get started and keep going, including full GDOS and SpeedoGDOS support, a powerful spell-checker, and layout options that make it a formidable challenger to word processors like WordPerfect for Macintosh!� All manuals and disks are included.� Asking $75 OBO.

One MiGraph COLORBURST 16-bit color hand scanner - WOW again!� This hand-scanner from Migraph works with the Falcon only, and allows true-color scans of just about everything!� Includes all manuals and disks, as well as interface cable.� Falcon only, asking $150 OBO.

One Supra 14.4 FAX Modem with cables - nice for browsing the web with.� Works great with STiK and CAB/Newsie/Oasis, etc.� Asking $50 OBO.

So. . . the total system, as priced above, with everything, is $925!� Buy everything together, and I'll sell it for only $825 OBO!� All you need to do is add an Atari monitor or VGA monitor (with appropriate adaptor), and you'll cruise into high-speed TOS computing without a hitch!

If you're interested, please e-mail me at brmiller@tiac.net, and we'll talk!� I'll verify that everything's in working order before I send it out to you, so if there are any problems, they'll be caught.� Finally, unfortunately, I have to insist that all transactions be conducted COD, with the buyer paying the COD and shipping costs.� I am only doing this because an unscrupulous individual stole my 1040ST from me by writing me a bogus check.

Thanks for your time!

I just thought I'd let everyone know....

There is finally a BBS Software with all of the great features of OBV/2 and Iniquity, but without the bugs and bad support. Infusion BBS Software is a new generation in BBS Software, modeled after OBV/2 and Iniquity with everything that the sysop can imagine..and more.

Some basic features are:

o Multi-node upto 255 concurrent users
o Light-bar support [arrow keys]
o Requires NO Fossil Driver [selectable FOSSIL, ASYNC, and Digiboard for each node]
o Online Configuration [menu editor, string editor, evemt editor, node editor, system editor, etc]
o Pipe Color Codes
o MCI Codes
o Powerful scripting language
o Internal One-Liners, Blacklist, voting booth, etc
o Internal Z-Modem, X-Modem, Y-Modem, Y-modem-g [no limit to external protocols]
o Internal COMM Program with internal protocols, Auto Up/DL
o Great support
o Basically all of the great features of OBV/2 and Iniquity combined

Infusion has been picked up by fuEl [international art group], and Infusion 1.0th will be released June 10th.

Come to the Infusion Home-Page at http://web.wt.net/~sparky/ibbs/ and jump into the JAVA Based Chatroom, or come to the ANNEX, the official Infusion IRC Server [irc.annex.net] #infusion / #bbs

send the author skaboy101 [Grant Passmore] E-mail at skaboy@usa.net

Hello, everyone:

The Falcon, hard drive, and scanner I was selling are now sold!�
Here's what remains of my esteemed inventory:

One copy of Calamus SL - the wonderful modular DTP package.
Includes all the base modules plus raster objects, vector objects,
and a few extra fonts from a DMC upgrade deal.� Everything you need

���� to do top-quality desktop publishing work.� All manuals and disks
���� included.� Asking $75 OBO.

���� One copy of Envision Elite - a great bitmap editor, with lots of
���� powerful functions.� Sort of a "mini-Photoshop," without the filter

���� plug-ins, this program allows full editing in color and has a
���� number of powerful brush and tool functions.� All manuals and disks

���� included.� Asking $25 OBO.

���� One copy of Papyrus 3 - WOW!� What a WP!� This document processor
���� includes EVERYTHING you need to get started and keep going,
���� including full GDOS and SpeedoGDOS support, a powerful
���� spell-checker, and layout options that make it a formidable
���� challenger to word processors like WordPerfect for Macintosh!� All
���� manuals and disks are included.� Asking $75 OBO.

One Supra 14.4 modem with cables - great for web browsing.� Asking
$50 OBO.

If you're interested, please e-mail me at brmiller@tiac.net.� The
remaining stuff clocks in at $225, but buy it all together, and I'll let
you have it for just $200 (plus S/H and COD costs).

Thanks!

brmiller@tiac.net

I present here my two most recent software which I hope they interest you.
they are progammed by Turbo C++ and run under Windows(3.11 and 95).
here is a short description of these two software.

1-Robot Spy 1.0
at my knowledge, this software is the first and the unique of its kind.
This software allow you to spy your friends who are on the net at the same time
of you, it permits to see exactly what they do on their screen, pixel by pixel,
anywhere, in the world, at the condition they are connected to the internet.
how does-it work?
it�s simple, you send a file to the person you want to spy telling to him it�s a
game or everythings else, the objectif is this person run the file. from this
time,
a batch file is installed on his computor, and everytime this person use internet,

this batch connects him secretly on our server.
on your side, you , after the installation of the other part of the software every time
you want, you can connect on our server with your password and have the list of all the
persons who received your batch and who are connected at this time.
the only thing you have to do is to click on the name of the person you want to spy.
a window opens containing exactly the screen of the person spied, you can have
ten pictures per second with 256 colors, if you switch to balck and white mode you can
onbtain a real time sequence, approximatly 30 pictures by second.

Robot Mailer 1.1
The message you are reading presently is sent to more then 20,000 newsgroups with
this software. This program automates FreeAgent, and reach with a connection of 28,8 Kbauds
5,000 news per hours. It can also find a maximum of 50,000 e-mail adresses from internet and
send a message in 4 or 5 hours. You can obtain with this sofware the most powerful tool of
mass transmittion on the internet.

Robot Spy 1.0..................20 US$
Robot Mailer 1.1..............20 US$
Both.................................30 US$

I�m sorry i can�t accept credit card, but you can send an international money order to:

Ben Hedi Nassef
1481 Ste-Catherine est #7
Montreal, PQ, H2L-2H9
Canada

Don�t forget to include your e-mail on a paper, you receice the software ordered in your
e-mail the day we receive the money order.

Geez--I _have_ an Atari 520ST, with the single-sided 720K drive and 512KB of memory and an 8 MHz 68000 CPU. It's great for playing Chaos Strikes Back (since FTL for some reason went out of business before it ported CSB to the PC, and I'm tired of playing Dungeon Master), but other than that, my old 12 MHz 80286 beat the pants off it in every other category. Way back in ancient days (1988 or so), Byte ran a comparison of the Motorola CPUs vs. Intel, and the 68000 at 8 MHz was equivalent to a 4 MHz 286 (if there were one that slow)... And you're comparing it to a Pentium?? Whatever you've been smoking, it's clearly toxic to brain cells <g>...

BTW, this is not just my lowly opinion. I showed your post to a couple of

former rabid Atari users (who had thousands invested in their multiple
1040ST systems), and they agree. While we remember the Atari with
fondness, it was by no means fast at anything, except in comparison to a
4.77 MHz 8088 machine. Let's not lose all resemblence to reality here...

Aren't I lucky that there is one large package that includes most of
the tools I need all together in one place! Still, if I need
something more powerful I can use a specialized app! Life is
wonderful!

Yes, but considering that it includes four major applications, it's
not that large. If you have a 280MB drive, it's LARGE. If you have a
2 GB drive, it's not so large. If you have a 3.8 GB drive, you hardly
need to worry.

I don't believe I ever compared CPU's. I compared RAM.

With 4M and Laser C, admittedly an austere enviroment, I outran
any PPro200 using whatever development tools were available.

It's all simply a matter of engineering and building solutions that
fit in the hardware constrants given.

NOT doing that is what turns these barn burners into sloths 10 times,
or more, slower than they should be.

The situation is not quite as simple as you make it out to be.

Got to agree with Hugo here - whilst the Amiga custom chips were once
well ahead of the field in terms of the video and sound they could
handle, they are now completely outclassed.

My guess is that since it should now be possible to put all the Amiga
custom chipset together with a 68K compatible processor core on a single
ASIC, and since the AmigaOS has such a nice small memory footprint it
could make quite a capable competitor to such things as the home NC and
WebTV.

Of course this was also the market that VisCorp wanted the Amiga for -
the difference with Gateway is that they have the investment capital and

marketing clout to make it work. Whether they have the technical design
skill to produce a good product at the right price point is another
matter. If they do, then the Amiga could start causing problems for
Acorn once again.....

Chris.

I think the "Idiots" are the ones who have been cross posting Mac and
PC bullshit into this newsgroup for the last four or five months.
The reality of it is, in c.s.a.st, the people are helping eachother
with a platform they enjoy. In every thread from the cross post here
lately, are blind stupid comments on eachothers operating system. 90%
of you don't know what the fuck your talking about. Mac users
are trying to keep their idenity and dream of a Mac perfect world,
and the PC users are Gates clones with sticks up thier ass. If you
were real computer users, you would go purchase a good RISC UNIX box
and perform some sort of useful function. I'm glad not to be part of
the PC clone world, and while Macs are pretty to look at, I don't want

to stand in a river of software that is constantly changing directions.

I disagree. You start downloading Netscape, get a hankering to play
marathon infinity, and what happens? Your file transfer flails. I want
to be able to play marathon and not have my file transfer
flail!!!!!!!!!!!!!!!!!!

First, running Word or Excel at the same time as Marathon or Doom or ANY game is easy, and worthless. Neither word or excel use the CPU during idle time, thus there is no multitasting going on. As far as Netscape and Marathon, this has nothing to do with the system really, Bungie made Marathon so that when it loads it disables the system and multitasking. Marathon locks out everything so it gets max CPU time. A bad multitasking system or not, nothing else moves while Marathon is running.   Try this, after starting your download, and loading marathon, hit command-shift-5 (*I THINK*)   Not sure about that, but there is some key command the re-enables multitasking.   This should allow your download to go on. However there is a performance hit, and again, not sure about the key command. Check the marathon news group for that.

I can't help but feel that a lot of games multitasking is basically multitasking for multitasking's sake. I mean, a lot of fuss is given to "wow, we can run Doom at the same time as Word and Excel" or something like that (under Win95, not RISCOS) but how many people actually DO this? I for one play games OR do serious stuff. Never do I do both at the same time. Perhaps during that coffee break, but I'd be loathe to leaving Windows apps running alongside a game like Doom or Quake.

Tim.

I tend to play games quite a bit under Warp while doing large FTP xfers
and other things. Not a daily occurrence, but I'd guess I'm doing that
at least 3 times a month.

I also tend to get lazy and leave things open all over the place -- as
long as the OS allows me to do that, it isn't a problem. Why close a
program I might want to get back to when it's not impacting me?

If I want to run GUI apps just one at a time, I can just use an Atari ST.
Even on the lowly ST, I was doing background xfers while running other
things. Most computers are expensive. Letting them sit mostly idle
because your OS is unsophisticated is quite silly.

>
>
>Yes, of course you are right. I think the point being made was how well

Like in two windows? On Linux or what? Win and OS2 don't have
enough vid speed in the GUI. In Linux there's almost no
difference between the console and the GUI. (Preen)

Well, not apps, but it's nice to be able to keep file and print
sharing going on for other people if a group of us are Descenting.

As far as home machines go, I think multitasking in the GUI is just
totally overated. Who uses it? It's just confusing to a newbie; he
does one thing at a time. Only real geeks really use their GUI. And
a lot of apps nowadays just ditch the standard Windows or 95 or
OS2 look and feel and do their own suped-up mega-resource-intensive
multimedia thing. Which is cool with me, cause Linux and X and
whatever-win-manager-you-use doesn't have a standard look and feel
like Motif or CDE. Linux apps use different things, motif
statically linked, or athena, or tcl/tk whatever. People use the
apps, not the OS.

Supposing we DIDN'T have a particular near-universal (but
sinfully proprietary) look and feel. Did we all want that,
or just a binary compatibility standard? (If we did just
want that, at what cost did we get it (with MS), and did we
really get it at all?)

Heh, it's not so long ago that people were deriding the Mac for having bitmapped graphics for graphics sake, or sampled sound for sound sake. It took a long time for them to be persuaded that graphics and sound were more than just useless toys, and could make computers easier to use and so increase productivity. Now all modern computers have hi-res colour bitmapped graphics and 16 bit stereo sound input and output, and no-one questions the benefit of these capabilties.

So with game multitasking: right now machines need all their horsepower to drive Quake at a maximum fram rate, and people have got used to disabling other apps when playing graphically intensive games. But very soon this won't be necesary: with 3D accelerators taking care of graphics processing even today's computers don't need to spend all there time running a game, and with processor and other computer technology improving dramatically pretty soon even your basic non-3D-accelerated PC will be able to run Quake well utilising less than half of it's processing power. Apple demoed Quake running in a window on Rhapsody alongside 2 QuickTime movies, all running at close to 30 FPS, on current hardware with pre-Alpha release of Rhapsody (their next-gen OS), at their WWDC.

Will anyone use this ? Sure. I doubt I'll ever want to play Quake and word process at the same time. But it'd be very useful if I could run Quake without disabling my fax and voicemail software, so the computer could keep on monitoring the phone as I played, or as it monitored e-mail and alerted me of any urgent messages, or downloaded files in the background, or compiled and linked a large project. Or whatever. Very soon probably most games will support multitasking in a window alongside other apps, and people will think nothing of using a game alongside another app, much as they think nothing now of full-screen, 30fps rendered 3D games.

John

It's a well-established fact that task switching (as opposed to true multitasking) is adequate for most people all the time, and the rest of the people most of the time. However, I do like to bring up a game or do some real work while long net data transfers are happening. I guess that counts.

I have not noticed any degradation in Quake (DOS or Windows) while other apps are open and quiet, although W95 works harder to free up the physical memory needed to start it if there's a lot running.

Word 2 used to bog screensavers down badly, so I'd say it was using CPU. I've also been told that Windows apps must process certain global event messages even when "quiet", leading to some slowdown. Can't say I notice it but.

DOS Quake doesn't block winsock TCP/IP transfers, although the packet response can lag a little (P120 system). W95 Quake is better again.

You're a little behind (smirk?). WinQuake's frame rate is barely
behind DOS Quake's at the same rez,and depth in a window,
and just as fast full-screen; it will quickly move ahead of DOS
now that DOS evelopment has stopped. Translation to 16 or 24-bit
depth on the fly still hurts, but it works fine.

JEDI wrote:
:   If I want to run GUI apps just one at a time, I can just use an Atari ST.
:   Even on the lowly ST, I was doing background xfers while running other
:   things. Most computers are expensive. Letting them sit mostly idle
:   because your OS is unsophisticated is quite silly.

And let's not forget, since this is (amongst others) Atari advocacy,
that you *can* run multiple GUI apps on an ST at a time.
It's a kind of MagiC...

Now, the thing about games multitasking is that the OS makers mainly use it to demonstrate how good their OS can multitask apps that aren't made for multitasking. There's no use that I could think of for running Doom and Excel at a time. Nothing to say against a quick dash of Tetris while downloading, or even Doom while downloading... but of an app that calculates something, I'd expect to calculate it fast enough for me not to *want* to run Doom in the meantime.

Needless to say, this is where all your over-bloated Windows apps fail. This is not a fault of Windows, mind you. The trouble is that such featureism (as being able to run Doom and Excel alongside) is being made to run on such an instable and unsophisticated kernel.

If I'd want featureism, I'd want it on a stable basis. If I can't havem or can't afford both, I'll take the stability.

Yours,
    Erik.

The only REAL multitasking things I would like to do is to download files while I am playing games. Win95 can do that to some degree, although not great. However, I am not given up any win95 games because of that.

Jedi, I'm confused.  What kind of system
1) is limited to "run GUI apps just one at a time"; and
2) is crippled for the duration of a Netscape download?

Surely no computer these days fits this description....maybe a Macintosh
Plus circa 1986 with MultiFinder shut off, but Netscape doesn't even run
on that system.  I thought every supported platform's version of Netscape
did background downloads -- what system are you referring to?  What system
can only run one GUI program at a time?

Are you talking about PDAs?

Calling ones opinion well established fact is probably a little dangerous, but I would agree with this part of the comment, that most people don't think they care, otherwise Windows3.x (and even 95), and MacOs wouldn't be so popular.

>and the rest of the people most of the time.

As one of the 'rest of the people', I can say you are wrong here. I care a lot nearly all of the time, and get really quite frustrated with a system when I can't move a window in a co-operative system simply because disk access is going on, or when the same thing happens under a pre-emptive system with a broken UI design, like a certain popular operating system I could mention. I care a lot.

and

There are different ways to force people into doing something. You can use the same tactic that the "catholic church" did in the middle ages across Europe. Sillence *any* concurent opposition thereby creating ingnorance! It's simple; *if* you don't know that anything better excists and where you'll find it, then you'll be happy with the worst (especially if it's the only one!).

> every one of us can make the choice to either use the computer or
not. We
> can each choose to upgrade or not. If we dont want the next new
thing,
> nobody makes us buy it. Some of us made the choice to purchase
systems

Yes they do makes us buy! I'll give an example:

In 1991 I bought an Atari PC4 (an 80286 AT pc-clone). These systems came equipped with Windows 3.0. Since I performed GFX-design I used Coreldraw 2. However I had severe problems with that program (everyone knows about that buggy CDRW2). In 1992 Corel released V3 which had several bug-fixes. So I wanted to upgrade my Coreldraw.

Guess what I discovered? This CDRW wouldn't work with my Windows3.0 (it needed 3.1). I had to "upgrade" my Windows too. But... Windows 3.1 doesn't work with 80286 pc's (the least was a 80386SX). So in the end I was FORCED to buy an entire new PC while all I wanted was a less buggy Coreldraw.

> which are well supported, others chose boxes with 3 or 4 apps and
are
> constantly bitching. You were free to make a choice and you made
it. If

Did I complain that I can't find software for my system? I'm just complaining about this worldwide ignorance for anything not-Micro$oft!

> >
> > CU

Anybody (or any group) that "fawns over" *any* particular
technology ought to be suspect. But the folks that would
have to be suspicious would be their bosses. And as I've
noted, these folk generally get their IS "information" from
TV commercials and the like.

It's really rather amusing, to me, at least, how that works.
I've seen it all over the place. In a heterogeneous Enterprise
environment, Wintels seem to always cost the most to support
on a per-seat basis. But when "how to reduce costs" comes up,
the answer always seems to be "spend more money on Wintels."

Go figure.

No. I don't, actually. What I have to do is *advise*
management as to the best course of action and explain,
in terms they can understand, the basis for my conclusions.
If they then choose to take a different course of action,
it is my responsibility to make *that* work as best I can.

I'm not out to impress anybody.

And I don't argue with 'em anymore. (Except where security
is concerned.) I give 'em *exactly* what they demand :-).

And the MS aficionados no doubt think you a Mac bigot.  And
you'll both call me a UNIX  bigot, I imagine.

I don't really care about the bigots.  Bigotry is a state of
mind that results from ignorance and irrational thinking.  Or
a utter failure to think at all.

Regards,
Jim

I have *never* seen anyone in the press claim that Microsoft created multitasking, OR the GUI, OR protected memory. If nothing else, things like the Amiga and Apple are common knowledge, even outside the computer savvy types. And the label "loony" is not used because someone uses system X; it's used when a system X user starts saying outlandish things. People don't get called lunatics for using Linux; but if they claim that Linux will crush OS/2, NT, and Win95, destroy Microsoft by 1998 and make Bill Gates a pauper, while the rest of the world is running Linux Alpha boxes, THEN the phrase "loony" starts getting bandied about fairly quickly.

There's a fairly inflamatory article in the Times (you can see it at http://www.the-times.co.uk/news/pages/Sunday-Times/stiinnsnd01001.html?1202653) that shows how the man on the street draws the battle lines. There are a few unfair positions (like "digital freak show"), but by and large, a lot of the points are on the mark, in terms of how the average consumer sees the OS wars.

:) He has been more civil lately. There was a time when he really pissed me
off. I may cuss and rant and rave with him now and then, but it is all fun
for me. I know I have it better than him anytime of the day or night:).
He has probably been kicked out of every social atmosphere he has ever been
assoicated with. Egad, it must be terrible to be an outcast from your own kind.
Maybe he ought to really think about purchasing Magic Mac. Even being the lout
he is, at least then I wouldn't think my time wasted if I steeped overhim
here.

Mike

This is the 21st century (almost), we have the internet, and millions of people with a viewpoint use it (including yourself). Please explain exactly who is "silencing" you or the company, os, way of life, whatever you espouse.   Silencing and ignoring are two different thiings. Just the fact that we are having this virtual conversation disproves your ignorance through silence theory.

It's simple; *if* you don't know that anything
> better excists and where you'll find it, then you'll be happy with
> the worst (especially if it's the only one!).

Please define better. Does that mean faster, more stable, less
conflicting, better supported. Does it mean them all or something else.

I think everyone knows about Corel.

>
> Guess what I discovered? This CDRW wouldn't work with my Windows3.0

Was that a conspiracy, or did 3.1 have features CDRW3 needed to run?

I had to "upgrade" my Windows too. But... Windows 3.
> 1 doesn't work with 80286 pc's (the least was a 80386SX).

I ran 3.1 on the Packard Bell 286 16Mhz my parents gave me 5 years ago. I
also ran corel 3.1 on it. BTW, the floppy from that 286 now resides in my
P166.

So in the
> end I was FORCED to buy an entire new PC while all I wanted was a
> less buggy Coreldraw.

No, you just didnt try turning off 386 enhanced mode on 3.1 on your 286. A
little research would have saved you money.
.

<snip>

> Did I complain that I can't find software for my system? I'm just

We are not ignorant of things not microsoft. I for one kinda got excited when rumors of Apple buying Be were rampant. I could use something like Be on a fast PPc if it was well supported. Hell even Rhapsody might be ok, but dont tell those crazy mac guys I said that.

Yes, I have surfed around the acorn pages enough to see you dont have the software I need, nor the software I like. Show me the AutoCad or Photoshop quality apps on the acorn.

Nate

>Anybody (or any group) that "fawns over" *any* particular technology ought to be suspect. But the folks that would have to be suspicious would be their bosses. And as I've noted, these folk generally get their IS "information" from TV commercials and the like.

The bosses often instigate the problem. I've seen cases where the boss says "we need PC people", and PC people get hired without regard to whether or not they know anything else, so chances are you end up with a PC only person. Second, the boss wants to save money, so they hire someone young; and young people are much more likely to not even know that anything other than Wintel exists, much less be able to work with them (I've seen very few MIS people over 40 who were gungho on Microsoft).

Finally, a lot of times MIS departments grow from nothing, and grow the sorts of people needed the most. Often, the software development department doesn't need lots of MIS support, so they may have one person who keeps the mainframe or workstations alive; but the executive pool needs tons of handholding, so more and more PC helpers get hired (or Mac helpers). So after awhile, MIS gets dominated by Wintel centric people, and the UNIX/VMS/Mainframe people are fighting a holding battle.

What's ironic is that the state of corporate computing has come nearly full circle. The PC initially gained popularity because it allowed you to do computing without MIS getting involved. Then departments got people to manage their machines, and then pretty soon MIS started managing all the PC's. And now we're real close to the state where network computers will be common, at which point things will be almost the same as the old mainframe oriented MIS.

Actually you're wrong. Win-3.1 does run on a 286, (I do it) but I guess that just underlines M$ marketing machine!

Newsgroups:
comp.sys.atari,misc.forsale.computers.other.systems,misc.forsale.computers.other.misc,misc.forsale.computers.other,comp.sys.atari.advocacy,comp.sys.atari.st

I have forsale the following system, approximately four years old.

Falcon Information:

System Contains:
Falcon 030 motherboard with:
* 4 megs ram
* 68881 Mathco processor

365 meg SCSI HD(2nd 3.5" bay)(4 partitions full of software)
1x CD-ROM(1 5 1/4 bay)
1.44 meg floppy(1st 3.5" bay)
2 open 5 1/4 inch bays, 1 open 3.5" bay

This machine was recased by me, and the ports that I chose to bring to the rear of the machine are:

Audio in/out(left/right RCA jacks) NOTE: THE only problem with this machine, and the only thing that has _ever_ given me trouble on this computer has been the left audio input channel. I think it is the plug on the motherboard, but I am not quite sure.

Another note about audio:

There are three front panel switches, one turns on/off internal speaker, one switches audio input to the mothberboard between the internal CD-ROM audio out and the raear panel audio in. The third switch deals with switching the Falcon motherboards audio out between the audio out RCA jacks and the headphone jack, also located on the front panel.

The reset switch on the front panel functions.
The keyboard is a TT030 keyboard, missing the F8 keycap. This keyboard has a keyboard reset switch installed internally, accesseble via the plug bay at the rare of the computer.
Video out with Screenblaster installed internally is brought to the back panel.
Parallel/Serial brought to back panel.
MIDI in/out brought to back panel.
Composite Video brought to back panel.

This machine works, and I shall include with it:
*VGA 15 pin video adapter
*ST monitor plug adapter
*All necessary cables
*No monitor
*All manuals/original disks that I can find.

Bidding starts at $650. I shall sell the system for the best offer.
Greg Linder

The only and really OFFICIAL SILIconvention'97 Results!

The SILIconvention�97 was held during easter 1997 in Bremen / Germany.
This are the official Results of this event.

You can download most of all entries from our FTP-Server:

ftp://ftp.siliconvention.com

, or our support-mailbox:

ADM-Mailbox Line 1: +0049-421-8498235 (Modem 28k)
ADM-Mailbox Line 2: +0049-421-8498234 (ISDN 64k)

If you�ve any questions, problems etc. mail to:

siliconvention@siliconvention.com

Ok, and on we go with the results :-)

Acorn-Demo-Competition:

1.	Xperience	213
2.	Icebird	158
3.	Jared	107

Atari-Demo-Competition:

1.	Avena	196
2.	Shadows	105
3.	Escape	66
4.	Therapy	60
5.	Pandemonium	42

The internet is a tiny proportion of the computing world. Especially
those that also READ these usenet groups.

> exactly who is "silencing" you or the company, os, way of life,
whatever
> you espouse. Silencing and ignoring are two different thiings.

Just the

Ask Epson, HP or Canon to write for example an Acorn driver for THEIR printers (or a Nextstep driver for that matter)? Back in the 80's it wasn't a problem to get a printer running on several totally incompatible systems. Nowadays they turn away if ain't talking Micro$oft language.

> fact that we are having this virtual conversation disproves your
ignorance
> through silence theory.

That's only you and me. And *do* you really *know* an Acorn machine? Have you *ever* used one let alone seen one? I have used (and owned) PC, Amiga's, Atari's etc...

> It's simple; *if* you don't know that anything

> conflicting, better supported. Does it mean them all or something
else.

Indeed. Faster (though I prefer the term smooth or prompt), indeed very stable, less conflicting, better supported (though that word probably has another meaning for you).

The response time taken for a certain action to occur is much shorter on Risc OS. The co-operative multitasking (which shares concepts also available on pre-emptive counterparts) was in it's early incarnation one o/t most stable of its time, today it's a very mature OS which still matches and even outperform most other OS's with real time anti-alliasing of text and graphics, real time solid window handling, the most simple to use and most powerfull drag and drop system between ALL applications etc.... Less confilcting because on the contrary to a certain Micro$oft OS, where ONLY Micro$oft applications multitask properly together, on the Acorn platform *all* apps multitask fluently! Better supported: I have more contacts with developpers than you, i can give them *personallly* suggestions which may (or may not) be included in future versions (ask any user of for example the Prophet accounting package that i use to run my business)

...lucky you... I (and many other) 286 owners never could run Windows
3.1 and certainly NOT Windows 3.11 (WfWg) to work on an 80286. AFIAK
The only windows that could run in "standard" mode was 3.0

> So in the
> > end I was FORCED to buy an entire new PC while all I wanted was a

> ..

Why should I have to know the inarts of a suposedly "userfriendly"
OS/shell and turn it off manually wereby my "forced" Coreldraw 3
couldn't be installed? Couldn't Micro$oft make it automatically
detect what system I had (and thereby turning of the functions that
weren't available)?

> > Did I complain that I can't find software for my system? I'm just

excited
> when rumors of Apple buying Be were rampant. I could use something
like Be

What do you mean by supported? Do you mean: If I could COPY software
from friends and relatives? Or do you mean: If I have a problem I

telephone the programmer and ask him to help me (though in my case,
I live abroad, email is more convienent)?

I opt for the latter. BTW. Have you ever called the Micro$oft
helpline? Or the Corel helpline?

> on a fast PPc if it was well supported. Hell even Rhapsody might
be ok,
> but dont tell those crazy mac guys I said that.

Be is only in prototype phase. Consumer apps won't be available
untill the system hits the street. Anyway somebody must be willing
(or enough openminded) to program ANYTHING on these new systems
otherwise it's a vicious circle. If U keeps saying "I won't buy it
untill well-known companies start writing software for it" and these
companies say "we won't write software untill more sales have been
generated" then nothing will happen and progress ends :-(

Also it's not because a well-known company writes a piece of software
that this software is automatically good.

> >
> > That's what *you* think... but then again. You don't KNOW any
better,
> > do you?
>
> Yes, I have surfed around the acorn pages enough to see you dont
have the

Photoshop
> quality apps on the acorn.

PhotoDesk 2 is an excellent "professional" image processsing/ photo
retouching/pianting package. Have you ever USED it? Since I'm only
into DTP work I can't really comment on Autocad style of software. I
know that we have our share of CAD/CAM applications but these are of
no interest to me (except for the occasional 3D rendering job)

Nonetheless you seem to forget that a fully working Autocad system is
NOT the average cheapo WIntel system that the punter has in their
homes! I'm talking of a home computer here costing a mere 1300 UKP
for a 200Mhz 32-bit Risc system. A system perfect for the soho market
with (on the contrary to what you believe) professional software for
a very good price.

What does your PhototShop costs? I guess a lot more than 270UKP (VAT
included) What does your Autocad cost (I ain't talking about the
light version)? The 3D design package that I use cost 99 UKP. And
that's a real time 3D modeller/rendering package with a few features
key listed here:

-real-time manipulation of bezier surfaces and spheres, with full
controll over U and V parameters for shading.

-Real time operations of ALL tools: No preview
-graphics engine suporting Wire-frame (uniform and shaded), uniform fill, Gouraud and Phog shading, texture mapping and true transparancy, plus a true-colour mode (able to manage several light sources, materials, etc...)
-two real-time lattice deformation tools
-real time texture mapping
-animation
etc....

See my page for a few examples of what can be achieved with Acorn systems.

The rotating RPC-logo and the rotating "new"-gif, the Starlight-logo on my personal pages as well as the entire page design, backgrounds (if any), buttons are all made with Acorn software.

Hmmm... I've been working in IS for the last few years. I can testify that the IS departments I've worked for are extremely distrustful of Microsoft.

Microsoft has a history of putting out unreliable "solutions" with a high cost of ownership. It is hard enough to live with this sort of thing on the desktop, let alone on a server platform.

So I generally find myself in a situation where the majority of desktops run an MS operating system. High-end workstations and servers run some flavour of UNIX. Not ideal, but desktop users can simply reboot when their machines lock up, crash, etc. This sort of thing is unacceptable for servers.

> ...lucky you... I (and many other) 286 owners never could run Windows
> 3.1 and certainly NOT Windows 3.11 (WfWg) to work on an 80286. AFIAK

Windows 3.11 will run only in 386-enhanced mode. However, Windows 3.1 will run without trouble in standard mode (I know this because I have to run it in standard mode to get it to work under the Linux DOS emulator). Windows 3.0 also supported "real" mode, which would run on an XT(!) provided that you had an EMS card with enough RAM on it.

I'm sure 3.1 ran on 286's. Maybe not very well, but it did "run".

Perhaps you're thinking of Windows for Workgroups 3.11? IIRC, that ran only on 386+, and after it had been on the market for a while Microsoft pretty much dumped Windows 3.1 in it's favour.

(Of course, Corel 3.0 may have need to run in "386 Enhanced" mode, in which case you needed a 386...)

OTOH, it was not uncommon (and continues to be fairly common) for the price of a Microsoft OS to be included in the price of "name-brand" PC's - frequently you cannot get a discount on the total price of the package if you do not wish to purchase the Microsoft OS.

But there certainly is an Amiga Persecution Complex, and it's best avoided by other advocacy groups. All the same, it's difficult not to become paranoid when everybody is out to get you...

I have a Mega STe mother-board, i have questions please
answer me, because i want take advantage of the board..

what type of HDD's for Mega STe can i use? internal,
external,removable-media..
what type.? : need special connector? (prices)
Exist IDE adapter for Mega STe?

Can I connect a ET4000 with Crazy Dot to Mega STe??
how cost Crazy Dot ?
how cost ET4000 ?

what monitor i need if i can connect Crazy Dot & ET4000 to Mega STe??
what monitor? with some special connector?
Is Nova Graphics card a good choice?

exist differents types of cases for Mega STe..??
what type desktop? tower? (prices) ..what case i need if a want connect
ET4000 & Crazy Dot to Mega STe Motherboard??

what languages & kits exists for Mega STe to programming??(prices)
(like C++,C,java,perl,databases..)

I know that megaste motherboard came with TOS 2.05..then the question
is ...which are the differences between it and TOS 2.6.???

I hear that megaste have keyboard input...... what type of keyboard
....an "atari-keyboard" or "PC-keyboard"?? (what is the cost of each)

Can I up the speed of Mste ??? (16Mhz to 32Mhz)

Thanks very much to anyone that answer my questions. Good Bye Friend./

PS: Sorry for my english./

For C I would recommend Lattice C 5.6, which is very complete and documented in english. Price is about $200, but it may vary.

Regards.

Not too many fundamental flaws. The fact that Intel makes a cheaper chip
that is typically 30% slower but has most of the market share for
general purpose desktop computing, and sells it at a decent price, has
kept RISC from permeating the general purpose computing world. It is the
defacto standard for supercomputers, and low to high end workstations.

And suddenly, the cloak was removed; and the true purpose of an advocacy
group was revealed. Hosanna.

The problem is that you need dramatically higher bus speeds to compensate for larger code size. Same thing with memory. It doesn't make sense, generally, to opt for a moderately faster, dramatically more expensive system.

Re: ATARI 1040 ST-fm First Word Plus Help Request

Dear Atari Folks,

I'm trying to help an older gentleman who invested in an Atari machine for word processing many years ago.

I need your help to find information about how to "export" several large, important documents from First Word Plus (the word processor) on the

Atari 1040 ST - fm (platform)

to any DOS or Windows MS Word, Wordperfect or ASCII format.

If you cannot advise, I may have to *print* the documents and then scan them with OCR! I'm hoping you may have a better, more straightforward solution?? Please?

Thank you, in advance, for any advice you may supply.

Pax,

Oh yes... if you fiddle with it to run into "standard"-mode
I remember CDRW 3 only running on "enhanced" mode (like all windows
apps nowadays)

Part of the "Amiga Persecution Complex" (you can substitute
"Paranoia" for "Persecution" IMO) is justified. Part of it is
not. While it's true that Wintelism probably had a lot to do
with the fall of Commodore, Commodore, for the most part, did
themselves in. Or at least did a lot to damage their own
cause.

Question the average *knowledgeable* Amiga-head on whom they'd
like to see hung by their thumbs, and I'll bet they'd as soon
name certain ex-Commodore execs as any particular Wintel
Conspiracy Participant.

Put the blame where it belongs.

Regards,
Jim "still has, and sometimes uses, his A3000" Seymour

There's a whole slough of them. I liked Jed, back before I found a real GNU Emacs for NT. It was a lot better than "Micro Emacs" and the other stuff out there, especially if you're used to GNU.

Some time a gome, I opened a Dos prompt from Borland Pascal (Protected mode), to run windows 3.11. Result:

```
C:\> win
```

"To run windows from a protected mode program, you need to run in standard mode. Please start with WIN /S"

Nice, I thought, that's the first time windows has actually told me how to fix a problem.

```
C:\> win /S
```

"This version of windows can not run in standard mode"

Well, next time a program tells me how to fix a problem it better work... (Shortly after I installed Linux, and everything is running smooth (see .signature)).

If you have access to a Macintosh, there is a great PD progam out called 1st Word Plus � RTF. What this little gem does is take a 1st Word file and creates an RTF (rich text file) that most major Mac WPs can read (like Claris Works-MS Word-Wordperfect) from there you can then save them to a PC disk and use on an IBM(if you need to).

Hope-this-helps   :-)

Well, they can choose between last month's version of the CPU and this month's, they can choose whether to have a 2 GB disk or a 4 (or even more) GB one, whether to have more than the new recommended minimum of 32 MB of RAM, and they can even choose to be *really* daring and buy non-Microsoft main apps -- some still do this, I believe.

So there is a sort of choice even in the Wintel market, though not a very enticing one for some of us here, I must admit.

Thankfully I don't have to go that route, but my poor people at my old work had and still have *no* choice. They don't even have anyone to show them how to do things any more, ever since I was made redundant.

Now they really /do/ deserve our sympathy.

Ah, yes: an updated version of when we first had "Lemmings" and "Oh
No! More Lemmings" running side by side on Acorns a few years back.

Nice one! :)

I think there is a rule against writing such calm and interesting
articles in threads like this one. You'll be reported to the Cabal.

Personally I'm interested in VLIW technology, because it moves a
lot of the optimization work to the compilers
(/interpreters/programmers). I suspect that will be a huge win
because competition between compiler-writers and so forth can be
separated from competition between CPU designers. Also it will
mean you can install new optimizer software and have a faster
system than you did 30 minutes earlier. That should boost
competition, too.

I still remember when my professor in University spoke about
superscalar versus VLIW and stated that theory and experiment both

indicated that they were about equivalent in efficiency, but that CPU designers like himself didn't like the "let George do it" philosophy of VLIW. It immediately sounded to me like the decision to do optimization in the CPU instead of in the compiler was motivated more by this desire to do everything yourself than by sound engineering principles.

(Basically, sound engineering principles say that you should _not_ do everything yourself.)

I'm a bit skeptical about Merced though, because it has not _one_ but _two_ millstones of backwards compatibility in addition to the complicating modality of MMX.

It is perhaps fortuitous that interest in Java has spurred commercial development of optimization techniques...

This was one of the original tenets of RISC, you may recall. I agree with the idea of putting much optimization in the compiler, but that optimization should be very high-level (on the order of long range dataflow structuring).

I don't believe VLIW will ever take off. Let me explain.

All VLIW does is offload instruction dependency management from the dispatch mechanism. In this way VLIWs are much like branch delay slots -- they assume a limited lookahead capability of the CPU. If you intend to look farther ahead than the number of instructions in the VLIW you have to put that dependency checking back in, which negates the whole advantage.

Today's CPUs are already quad-issue and some have lookahead much farther than that, very often crossing branch barriers (which VLIW will not). With VLIW practically limited to two or three instructions by typical instruction interdependency it just won't outperform existing systems, much less future systems. Furthermore it causes gaps in the instruction stream, adding additional burden to the memory requirements during instruction fetch -- already a critical resource.

If there's one thing that Intel has shown it's that you can do a damn good job with superscalar, superpipelined systems with sophisticated instruction decode, dispatch, and branch management. Expect to see more of that, as well as systems which are much more cavalier in their calculation of instruction sequences following branches that might not be taken.

maybe not, I am looking foward to Lightwave3D 5.5 myself, and so are
THOUSANDS
of other people, not just with 95 or NT, but with MacOS, Solaris, and IRIX
on their machines.
MainActor is available for NT also, much nicer than the Amiga version.

I got an A3000 Vlab Motion Complete system I am dumping.
Comes with 12 years worth of Amiga stuff Ive collected.
Anyone interested?

X-Deja-AN: 239108089
Organization: Hula Net, Inc. Hawaii's Newest Internet Provider
Reply-To: fantasia@hula.net
Newsgroups: comp.sys.atari.advocacy
Content-Disposition: inline; filename="income.txt"

A little while back, I was browsing these newsgroups, just like you

are now, and came across an article similar to this that said you

could make thousands of dollars within weeks with only an initial

investment of $5.00! So I thought, "Yeah, right, this must be a scam,"

but like most of us I was curious, so I kept reading. Anyway, it said

that you send $1.00 to each of the 5 names and address stated in the

article. You then place your own name and address in the bottom of the

list at #5, and post the article in at least 200 newsgroups. (There

are thousands) No catch, that was it.

So after thinking it over, and talking to a few people first, I thought about trying it. I figured what have I got to lose except 5 stamps and $5.00, right?

Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with my country Post Office, and others had with US Post (1-800-725-2161) and they confirmed that it is indeed legal!

Then I invested the measly $5.00.............

Well GUESS WHAT!!... with in 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had made a total of over $1,000.00!!!!!! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in ....

It's certainly worth $5.00, and 5 stamps, I spent more than that on the lottery!! Let me tell you how this works and most importantly, Why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:

STEP 1: Get 5 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside EACH of the 5 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one paper in each of the 5 envelopes and seal them. You should now have 5 sealed envelopes, each with a piece of paper stating the above phrase and a $1.00 bill. What you are doing is creating a service by this. THIS IS PERFECTLY LEGAL!

Mail the 5 envelopes to the following addresses:

#1 B.C. Smith
P.O. Box 170
Greenland, AR 72703

#2 Beddingfield, Bobby
12404 Nokesville Road
P.O. Box 40
Nokesville, Va 22123

#3 Keen, Callye
44181 Bristow Circle
Ashburn, VA 20147

#4 Tom, BDB.
Via Damiano Chiesa 10

00010 Marcellina (Roma)
Italy

#5 H. J. Sung
1839 Keeaumoku St.
Honolulu, HI 96822-3004

STEP 2: Now take the #1 name off the list that you see above, move the other names up (5 becomes 4, 4 becomes 3, etc...) and add YOUR Name as number 5 on the list.

STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 25,000 groups) All you need is 200, but remember, the more you post, the more money you make!

Don't know HOW to post in the newsgroups? Well do exactly the following:

FOR NETSCAPE USERS:

1) Click on any newsgroup, like normal. Then click on "To News", which is in the top left corner of the newsgroup page. This will bring up a message box.

2) Fill in the SUBJECT with a flashy title, like the one I used,
something to catch the eye!!!

3) Now go to the message part of the box and retype this letter
exactly as it is here, with exception of your few changes. (remember
to add your name to number 5 and move the rest up)

4) When your done typing in the WHOLE letter, click on 'FILE' above
the send button. Then, 'SAVE AS..' DO NOT SEND YOUR ARTICLE UNTILL
YOU
SAVE IT. (so you don't have to type this 200 times :-)

5) Now that you have saved the letter, go ahead and send your first
copy! (click the 'SEND' button in the top left corner)

6) This is where you post all 200! OK, go to ANY newsgroup article and
click the 'TO NEWS' button again. Type in your flashy subject in the
'SUBJECT BOX', then go to the message and place your cursor here. Now
click on 'ATTACHMENT' which is right below the 'SUBJECT BOX'. Click
on
attach file then find your letter wherever you saved it. Click once
on your file then click 'OPEN' then click 'OK'. If you did this
right,
you should see your filename in the 'ATTACHMENT BOX' and it will be
shaded.

NOW POST AWAY!

FOR INTERNET EXPLORER:

It's just as easy, holding down the left mouse button, highlight this entire article, then press the 'CTRL' key and 'C' key at the same time to copy this article. Then print the article for your records to have the names of those you will be sending $1.00 to.

Go to the newsgroups and press 'POST AN ARTICLE' type in your flashy subject and click the large window below. Press 'CTRL' and 'V' and the article will appear in the message window. **BE SURE TO MAKE YOUR ADDRESS CHANGES TO THE 5 NAMES.** Now re-highlight the article and re-copy it so you have the changes.... then all you have to do for each newsgroup is 'CTRL' and 'V' and press 'POST'. It's that easy!! THAT'S IT! All you have to do is jump to different newsgroups and post away, after you get the hang of it, it will take about 30 seconds for each newsgroup!

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

If these instructions are too complex to follow, try Forte�s "Free Agent." It is freeware for noncommercial use. To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.

That's it! You will begin receiving money from around the world within days! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you con invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

Now the WHY part:

Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #5 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #4 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #3 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #2 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #1 and they each only receive 5 replies, that just made me $3,125.00!!! With a original investment of only $5.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:

at #5 $15.00

at #4 $225.00

at #3 $3,375.00

at #2 $50,625.00

at #1 $759,375.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $5.00 to names on the list, putting your name at number 5 again. And start posting again. The thing to remember is that thousands of people all over the world are joining the Internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $5.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the Internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual Internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest. Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH. **By the way, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 5 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k.

This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!!

Don't listen to the people that don't trust it and continue to say it's illegal and don't work... They are just too much skeptics.

You also may want to buy mailing and e-mail lists for future dollars.

Please remember to declare your extra income.   Thanks once again...

Erm, what does this have to do with me and, even more to the point I
raised, my ex-colleagues who have real jobs in real offices to do, but
```

do not involve Lightwave (or factory machine control, or weather map generation, or...) ?

Instead of mere thousands there are countless *millions* of users just doing an ordinary job of churning out reports and briefing, preparing and giving presentations, recording expenditure and those kinds of activities. What good is Lightwave to them?

Meanwhile, as I well know (as their ex-support person who still visits the old office from time to time) they struggle on gamely and have learned to cope, however inefficiently or awkwardly: I have a whole string of real-life tales I could relate; but obviously not here.

However it is *very* satisfying to know I no longer have to deal with, or even touch, a Wintel machine ever again :))

hehe, yes, playing descent with doom samples ;)
well, the win dosshells don't take care of gus sound output ;)

the solution for future would be sonud output of active window,
maybe faded in, and still some priority levels to let the beep
of another program working get through.

I don't know where people come up with this stuff. SCO does not own an exclusive right or copyright to Bell Unix. Companies get non-exclusive licenses to the source for Bell or Berkeley Unix and implemented systems that they in turn own and sell. There are lots of unix versions on t the market, both freeware and forsale, and many of them licensed either the Bell or Berkeley source for hte kernel and/or the system commands or othe facilities, but there is no sense in which SCO owns Unix.

In the future, support for threads is going to play an increasingly important role. systems based on Mach, like NT and OSF/1 are poised to do well in this arena, as are OS/2 and Solaris 2. It remains to be seen what will happen to the other players.

Not really. Code tends to cache well because most execution time tends to be taken up in cachable loops. As long as the data fields are the same width the data bandwidth would be about the same for RISC and CISC (maybe even slightly lower for RISC due to better use of registers) so overall bus usage isn't all that different. I suppose RISC processors might benefit from slightly bigger instruction caches.

And while many RISC designs do produce a significantly higher code size this isn't always the case. For example an ARM implementation of a routine is very often no bigger (or only slightly bigger) than the equivalent 386 implementation because although every instruction is 32 bits, you tend to need fewer instructions on average to solve the problem.

As commented elsewhere in the thread, Lemmings and Oh No more Lemmings
was made to work in the Desktop, didn't Krisalis work out a protocol
for sounds to co-exist with each other?

ISTR that they were willing to let anyone have this for free, guess
thats gone to pot now, since Krisalis left the market.

dom.

Your anti-M$ bias is outweighing your connection to reality. M$ is the center of the mainstream PC industry.

The model is one of interoping around an OS, like all other computer systems, including OS2, the Mac, NeXT, Sun, HP, AIX, etc.

The big difference is that M$ is the only model where the all other components, hardware and software, than the OS can come from other suppliers. Intense competition characterizes hardware, including CPUs, motherboards and their chips, hard drives, and other such components.

For instance, the PC CD-ROM market itself is intensely competitive with a number of vendors offering products. When I bought my PC, I had a research section on each hardware component. I recently added 32 Mb of RAM for $150 at a computer show where a number of resellers offered the trade-in of old RAM (they tested it with a little machine).

The commoditization of hardware, as well as software, is the great fear of the enterprise server/DB market. The splintering of Unix has given added value to the individual Unix vendors. These vertically intergrated companies selling lines of proprietary hardware and software are direly threatened by the technological spread of the PC industry into their markets.

The response has been to say the enterprise is "locked into" mainstream, Win32 PC industry based solutions. The promise of Java and NCs, of course, is offered to give a grain of truth to these projections.

More likely, Java, the internet, and the componentization of software will speed the takeover of the enterprise by the PC industry. Capitalization, when applied to computers, is primarily the application of computerization to labor to increase productivity. Remember when Wang word processors cost so much but were affordable for high priced secretaries, etc, only to be replaced by the general purpose computer. The same thing is happening to servers, as has happening to minicomputers.

The computer is going to do some much more in terms of ease-of-use, including programming and administration by the average user on networks. This trend will most likely exploited by the PC industry than the Unix culture.

Consider the revolution in programming that modern applications have wrought. Before Visical, programmers had to code each iteration of a spreadsheet that the casual user does today. Such is happening to the creation of apps today. This is not something we can expect from the Unix culture. They will be relegated to the dedicated high end markets where they can be afforded.

Today practically everyone but Sun develops products for the Win32 platform. M$ just released its Commerce Server for $5000 replacing $60,000 Unix systems.

John

Uh-oh, sounds like product dumping. The same type of dumping which is killing Netscape. The same kind of dumping what made Windows 3.0 the de facto OS.

When will Mircosoft learn how to play fair? Gates and co. are merely a bunch of big bullies taking advantage of their position.

At this point, I wish Microsoft's people would cash in their stock and retire. They're not making decent operating systems, let alone end-user software.

Why did you do that?
win 3.1 will run fine on a 80286 with enough memory (in standered mode)
win 3.1.1 requires a 386 tho...

Blair Davis

BTW, What is all this hassel over different systems? Each system has it's
advantges for different things. I have 486's, atari 8-bits & st's,
amiga2000, c-64/128, mac II lc, ti's, old S-100 z80/8080 based systems.

why do we need to fight over this?

also, I am not rich. I have collected my hardware thru swaps and even in
the trash.

There are Sun and Alpha compatibles, and NeXT hasn't made hardware for
quite a while. (OS runs on Sparc and Intel machines).

I have an old 1040 ST with a black and white monitor, a whopping 20 megs
of hard disc storage and a Cannon BJ 100 printer that I would like to
sell. The computer would make a good doorstop or prop up for a table
wihth a short leg and the hard drive is big enough for a corner stone in a
modern repliction of a Gothic Cathedral...:)

If you, or any one know has an undying loyalty to Atari... email me and
make an offer.

Thanks,
AndB.

Can't you amiga people stick to comp.sys.amiga.advocacy? I really
don't think you're going to convince many Windows NT, OS/2, or Linux
users to go out and buy amigas.

You could all tell each other how wonderful the amiga is, and you
could all reply back to each other agreeing with yourselves.

I disagree. A gun is a neutral thing, it's the idiot pulling the trigger that does the damage. MS products are harmful in themselves, as numerous W95-install MBR overwrites and drive spammings prove. Another difference is that you can, however, delete the MS from your drive and thus restore it to health. You can't unshoot a gun.

So, you takes your pick there, I guess.

Me, I'm for gun control (and living in a relatively nonviolent place that practices it: Canada) and thoroughly against MS. Though guns are neutral in themselves, there are millions of idiots. As the sales figures for W95 attest ;)

While others have have their fun attacking the good sense of this
posting, count at least one individual who finds Gate$ support
of anti-firearms freedom repulsive. Of course, he has the right
to fund any cause that he chooses. We, the free, also have the
option to choose to not support Gate$.

Thanks for pointing this out...it is another good plank to add
to the platform: "In a world without fences, who needs Gate$?"

Seems like the same thing to me... it's not W95 that causes problems,
it's the idiot who clicks the install button...

Unfortunately one "feature" of uninstalling applications under Win/95 is the common "megabytes of shrapnel left behind" syndrome.

Win/95 is a smoking gun with you often left laid out in one corner of your office, reeling in horror from the bullet wound.

How's that for over-stressing a point?
Well... the point that Win/95 and NT are pretty backward in oodles of ways.

Thomas

To use the same analogy: M$ products are not armful: you need an idiot
to take the CD and install them on your HD...

(and the stupidity of this argument should say something on the stupidity
of guns being neutral objects, not to talk about the inherent stupidity
of this thread :-)

    heh - likewise.  I've got a  Falcon and have  been cruising the  net
with it for over a year, and  have WWW, email, USENET, and FTP  covered.
And I now  figured out  IRC as  well. And  all without  "hack n'  slash"
(well, maybe a little work with a text editor :) ) Now all I need is a
faster modem.....

    maybe Sinclap should consider glueing his feet to the floor so they
won't wind up in his mouth - just like his hero and mentor, Rush
Limbaugh. The man's idiocy has proven to be vast.

    Oh, BTW Sinclap, while we're at it, go and get yourself a real ISP.
One that will allow your Mac to use its features, including the ability
to use a proper newsreader (like I'm doing with NEWsie) instead of
having to use Dejanews via Lynx.

Mmmm, okay. I did stretch a bit there. But, at least Smith and Wesson
don't attempt to force you to buy a gun with your house and charge you

for it whether or not it is included.

Hello folks,

I just have a problem with my shitty joystick and would like to buy a better one (or two). Actually, I'm looking for the good old KRAFT joysticks. Does anybody know if there are still stores that have these kind of joysticks? (I'm asking mainly german ST users, for this kind of joystick is from Germany, but if you know anything about it, please contact me...)

Cheers,

Sebi a.k.a The Hidden

Dynamics of Germany produced an excellent joystick called the Competition Pro, and clones of it for other brands. I'm not sure if they're still around but the Pro was very popular in England and I bought a clone of it about a year ago (but the shop has since closed)

Well, no offense, but I have a Pro Tools 4 system, and Avid system, and more that I work on daily. I think I can say fairly safely that I'm well aware of the current state of the art... :)

> The Falcon, as Ive seen demonstrated, is easily
>replaceable by a $700 6100/7100 series PowerMac, or even a

>Cubase, for instance, on both platforms is barely
>comparable.

Again, what you fail to address is a comparison between PROFESSIONAL systems. The Mac's stock converters are crap, (the Falcon's are a bit better at least), but NO pro is going to use either of those for a serious project. What IS important number of INPUTS and OUTPUTS (lots of them) and quality of them.

My point was, and still is, that the Falcon can be upgraded to eight +4 balanced line level ouputs and inputs for well under a grand.. that is not the case on the Mac. The CURRENTLY AVAILABLE cheapest solution to get 8 balanced line level ouputs on the Mac is the Pro Tools Project system, which I've seen used for around $1800. This is because the DSP port on the machine makes building them easier and more affordable. The Mac will catch up, I'm sure, but not yet.

> Both machines, without adding additional hardware (key
>phrase here), provide a stereo in and out.

See above.. "without additional hardware" is pointless if you're serious.

I'm glad you're happy with your Cubase Audio system on the Mac.. I
wouldn't be unless I bought a Pro Tools III system as the front end (for
around $7k).

Not only are the internal A/D and D/A converters on the Mac not up to
par, there also is a big DELAY when listening to previously recorded
tracks and trying to record new tracks. In other words, the previously
recorded tracks are delayed relative to what you're playing.. something
that I am NOT able to deal with, because my music depends on good
timing.

> Atari loyalists are a fantastic bunch, but if youre
>genuinely concerned about the bang for the buck youre
>getting from your hardware, take another look at the
>competetion.

Again, no offense, but if the issue is bang for the buck in a
professional solution, the Falcon still is the best buy. Yes, there are
plenty of solutions with better bells and whistles, but, properly
expanded, a Mac is nearly double the price.

Firstly this isn't posted to Amiga groups only!
Secondly I'm NOT after Linux nor OS/2 users, I'm after the world
domination of Micro$oft.

I just hated when people dictate me what sort of computer to buy and
what software to use! How do you WIntel folks call that: "Freedom of
choice!"

More trivia for the pot...

From the April 14, 1997 issue of Computer Reseller News, pp. 176, "Executive Briefing" column, an article entitled "For Gates: Thicker Skin, Lawyers With Less Free Time":

It seems that a gentleman by the name of John Leonard (apparently a critic for "The Nation, New York" magazine and for "CBS Sunday Morning") recently publicly blasted Bill Gates for getting his (Leonard's) son, Andrew, booted

off of AOL. It seems Gates was upset by a satire written
by Andrew.

The connection, you ask? AOL recently signed a big IE
deal with MS.

Regards,
Jim

Just exactly who was it that handcuffed you to a Wintel box??  Each and
every one of us can make the choice to either use the computer or not.  We
can each choose to upgrade or not.  If we dont want the next new thing,
nobody makes us buy it.  Some of us made the choice to purchase systems
which are well supported, others chose boxes with 3 or 4 apps and are
constantly bitching.  You were free to make a choice and you made it.  If
you cant find software or support, that is not our problem.

>

�

�More trivia for the pot...
�
�From the April 14, 1997 issue of Computer Reseller News,
�pp. 176, "Executive Briefing" column, an article entitled
�"For Gates: Thicker Skin, Lawyers With Less Free Time":
�
�It seems that a gentleman by the name of John Leonard
�(apparently a critic for "The Nation, New York" magazine
�and for "CBS Sunday Morning") recently publicly blasted
�Bill Gates for getting his (Leonard's) son, Andrew, booted
�off of AOL. It seems Gates was upset by a satire written
�by Andrew.
�
�The connection, you ask? AOL recently signed a big IE
�deal with MS.

Evidence of behind the scenes arm twisting on the part of MS like this surfaces all the time. This isn't the first (by a long shot); I don't expect it to be the last.

What kills me, is that with all of the evidence, if anyone dares accuse MS of manipulating the press, the MS sycophants and Bill Gates cult worshippers that infest these newsgroups all join together in chorus to recite their "That's a conspiracy theory," mantra. Thereby seeking to impugn the credibility of the message and (especially) the messenger.

As if calling something a `conspiracy theory' automatically makes the message  non credible. What these apologists deliberately try to gloss over is the fact that since the dawn of time there have been `conspiracies', from back office politics, to secret boardroom meetings, to deals consummated on the golf course, to the `independent' press serving as the mouthpiece for its editors' interests.

Well, before we go this far, we should ask if Mr. Leonard indeed has solid evidence that it was Bill Gates who got his son kicked off. Did the kid break any AOL rules in the process, or perhaps with some other postings/emailings/chat activity? And would someone as much in the public eye as Gates really pull such a stunt, knowing that the world would find out about it?

I'm not saying that it didn't happen, mind you; but this is a severe accusation, and like all accusations against someone's character it must be backed up with evidence. What evidence does Leonard provide?

The Competition Pro is a great stick, I have two of them (Bought them
in '88 I think.) and they still works. I've smashed a keyboard,
countless floppys and even an Amiga 500, but the joysticks survived...

The only _direct_ evidence I can think of is the NASA situation where MS' buddy Garman banned Macs (later overturned by the Inspector General, but too late to stop them from moving WIndows computers in). Even here, I don't see any evidence that MS was involved.

I personally don't believe MS _has_ to directly manipulate anyone. They have marketed themselves into the position that they are considered by the press and many MIS managers to be the only company that counts. The media falls all over itself bragging about how MS invented multitasking, protected memory, the GUI, and anything else related to computing and create an environment where anyone who criticizes Microsoft is labeled a loony.

From what I can tell, BG and MS have made no secret of it. This was implied in the article I noted that started this thread. (I rather doubt that CRN would've been so explicit about it if they hadn't the evidence to back it up. Can you say "libel"?)

Then there's the on-line article referenced previously:

http://www.sfbayguardian.com/Epicenter/96_05/052996comp.html

Check 'em out.

>Did the kid break any AOL rules in the process, or perhaps with some

Apparently not.

> And would someone as much in the
>public eye as Gates really pull such a stunt, knowing that the world would
>find out about it?

Ego? Or perhaps the subject of this thread is a clue? Hard to
say, me not being Gates and all :-).

Neither are you going to convince amiga owners to go out and buy a PC,
so why don`t you stick to your PC newsgroup and go on with your life
beleiving how wonderful PCs are.

I don`t own an amiga, so don`t try to give me any PC VS amiga
arguments...

Subject: ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Date: 1997/04/23
Message-ID: <5jm9ss$65g@news.gdi.net>
X-Deja-AN: 236972880
Organization: Global Datalink, Inc.
Newsgroups: comp.sys.atari.advocacy

Please take the time out to read this email. it is worth your time.

ADVERTISE TO OVER 100 MILLION PEOPLE FOR FREE!!!
Or send a message to millions of people...

NOW YOU CAN ADVERTISE FREE AND GET DRAMATICALLY

MORE RESPONSES THAN ADVERTISING ON NATIONAL TELEVISION

With E-mail your potential customer is forced to read at least the headline of your letter. Unlike TV, magazines, newspaper ads, and direct mail where more than 99.99% of the recipients will skip right over your advertisement.

TURNS YOUR COMPUTER INTO A CASH REGISTER: Conservative estimates indicate well over 100 MILLION people will have E-mail accounts in the next year! E-Mail Blaster turns your computer into a cash register by giving you FREE, immediate access to all of them. Do you think some of the more than 100 million people with E-mail addresses would be interested in your products or services? Even if you don't have your own products or services you can still make money buy promoting our computer software!!!
You can make money with our new software called E-MAIL BLASTER

Here's how:
* By Using E-Mail To Sell Your Products & Services
* By Using E-Mail To Sell our Computer Software such as: Email Blaster, Web Walker,
  Email Lock Box etc.
* By Renting or Selling Your E-mail Addresses
* By Becoming A Distributor for e-mail BLASTER

MUCH FASTER: With bulk E-mail you get responses back in 1 to 4 days instead of waiting weeks or months like with television or print advertising. You can begin filling orders the same day you send E-mail.

FREE ADVERTISING WORTH MILLIONS: It costs millions of dollars to mail out millions of letters using the United States Postal Service! Now you can send your ad to MILLIONS of people for FREE using E-Mail BLASTER

E-MAIL BLASTER IS ACTUALLY 3 PROGRAMS IN 1: E-Mail Blaster is amazing new technology and the most advanced bulk E-mail software on the market today. (1) E-Mail BLASTER automatically extracts E-mail addresses from America Online, CompuServe, Prodigy, and the other online services, the Internet, web pages, news groups, and hundreds of other sources.   (2) E-Mail BLASTER automatically stores the E-mail addresses in your computer along with keywords that describe hobbies and interests to created highly targeted E-mail addresses.   (3) E-Mail BLASTER sends your marketing letter or ad to MILLIONS of targeted E-mail addresses at the push of a single button!

HOW DOES E-MAIL BLASTER WORK? E-Mail Blaster has dozens of special filters to automatically harvest E-mail addresses from major online services such as: America OnLine, Compuserve, Delphi, Genie, and of course the internet.

AOL AUTO EXTRACTOR: E-Mail Blaster has many special features like the AOL Auto Extractor that let's you use a regular dial-up Internet connection to collect names and addresses from America Online. Collect America Online addresses without being a member. Allows you to download names and addresses from America Online without paying membership fees or online charges. Auto Extractor for all of the online services and Special E-mail database search engines will also be available at no additional charge.

SIMPLE TO USE: E-Mail Blaster does all the work for you. Unlike other programs where you must cut & paste addresses, E-Mail Blaster does it for you automatically. And, unlike other E-mail programs, with E-Mail Blaster there is no need to purchase any additional software

SPEED: Your time is important. E-MAIL Blaster is DRAMATICALLY FASTER at extracting and sending E-mails than all the other programs on the market that we tested it against.

NO SPECIAL EQUIPMENT NEEDED: E-Mail Blaster runs on a PC with Windows 3.xx Windows 95, Windows NT, a 386 or faster processor, 4 MB RAM, and a hard drive with at least 10 MB free and your own SLIP or PPP connection. No other software needed. Also runs on a Macintosh with Soft Windows installed.

****
This message was sent using E-Mail Blaster.

E-Mail Blaster is The World's Leading Bulk E-mail software.
With E-Mail Blaster you can advertise to over 100 million people for FREE!

Cost: We are giving away Email Blaster your only cost is $165.00 License fee.

THAT'S IT!!!

Our company is in the software business of developing cutting edge products, so we know if you have the opportunity to use our software FREE you will be our future customers. We know we need you to make our software business a true success!

(Please if our lists are incorrect put "remove" in the subject and just hit "REPLY" and you will not be bothered again. Please forgive our mistake).

Actually, I found about two months ago that a couple of threads
apparently already running on some other advocacy NGs had just been
cross-posted to the Acorn advocacy group. I don't know whether any
of the other NGs being reached by this thread were added at the same
time, or were already involved in the discussions.

Thus we now seem to be all one big happy(?) band, whether we want this
or not, so I suppose we're certain to get (over time) every possible
Machine A versus Machine B combination, as well as every OS (including
all UNIX variants, no doubt) and will just have to plough through
them.

I actually enjoy reading about the other machines, and sometimes learn
something new -- and occasionally even something really interesting --
but a lot of it is a bit tedious; but that goes with the Advocacy

territory :-|

Newsgroups: comp.sys.atari.advocacy

I currently have for sale:

* Atari (C-labs) Falcon MK-I �030 with:
- 14mb ram
- PowerUp 32mhz clock accelerator (20% speed boost)

This is only about 18 months old, and is in like-new condition. Will come with all the manuals and software, and in the original box. No Hard Drive or monitor is included. Does include adaptors for both SVGA monitors and the old Atari color monitors (or compatibles)

Other items:

* Apex Media

* Blowup hard-I

* Also I have 4 4mb 30pin parity simms (3 chip simms, not 9 chip)

Make some offers. They go to the highest bidder. You pay shipping in all cases. Would prefer to sell the Falcon, Apex, and Blowup as a package if possible.

Please reply to: dhbutler@tiac.net

Good processors will alway be used.
Is grIntel still selling 8086?

And the Phenix will use either 040 or 060,not 030...

[I left Joe's entire second paragraph for context.]

I don't know, Joe. I'll admit that a goodly portion of the industry press seems to be in love with MS, but MS *does* take some hits as well. I've generally found that the more clueful (sp?) the publication, the more realistic its coverage.

And then there's advert dollars--ever a factor in how most publications cover the "news".

As for IS folk: I don't think that IS, in general, is quite so enamored of Wintel as you seem to feel they are. In fact, from *my* reading, a significant portion of professionals in the IS field are quite suspicious of Wintel. (Most with what they feel to be good cause.) Whence most of the pressure to deploy Wintel comes is from the bosses of these IS professionals. These managers and execs are largely clueless as regards the intricacies of Enterprise systems architecture and management--but they *do* watch TV.

[Btw: MS knows this. That's why they've been targeting the managers/bosses of IS folk, rather than the IS folk themselves. I no longer have the cite, but MS admitted to this strategy quite some time ago--admitting that they had gotten precisely nowhere with IS professionals.]

As to "anyone who criticizes Microsoft is labeled a loony."?

Hmmm... I don't know as "looney" is quite it. We're generally labled as "anti-Ms bigots", "unrealistic", "out-of-touch", "UNIX bigots", "control freaks", "name-your-favorite-non-Ms-bigot", or whatever. But the only opinions I really care about are those of my colleagues. These are the only folk who are sufficiently clueful to have the right to question my judgement. And you wanna know something surprising? Even many of the "Wintel-heads" I know find many of my concerns regarding Wintel largely justified. (We mainly disagree about what can be done, is fighting it worth it, and the like.)

But then again, I've been told by many "Wintel-heads" that I'm one of the "less rabid" (read: "more rational") UNIX-heads. I suppose that's a compliment :-).

Any way, I don't see things looking quite so bleak as you do, Joe.

Regards,
Jim

You sure run in a different crowd than I do.

Our entire MIS group fawns over MS technologies. Every time we have a problem, their solution is to spend a few tens of thousand dollars more on Microsoft products. When they couldn't make cc:Mail work, they wanted to run to MS Mail. When they couldn't make Netware work, they wanted to dump it in favor of NT. They are _constantly_ trying to get us to dump all of our Macs for Windows--in spite of the fact that the Windows computers cause probably 10 times as many problems (for roughly equal numbers of computers).

OK. Choose your phrase. But it all adds up to the same thing. I opposed putting MS Mail in and suggested that running from Netware that we couldn't fix to NT wouldn't necessarily solve the problem and got creamed for it.

> are those of my colleagues. These are the only folk who are
> sufficiently clueful to have the right to question my judgement.

Unfortunately, that's not true. You also have to impress your upper management. If the MIS group is constantly fawning on MS and MS spends a gazillion dollars on advertising, you start out in a very difficult position.

I don't see things as completely bleak. I _do_ see that it's an uphill battle. Rhapsody will help, but there will still be a ton of MS bigots to deal with.

AFAIK, the 260ST was never released fully. I was one of the first ST owners in my area and it was a 520ST that I got. The point I was trying to make was that all Ram is available under TOS whereas under the Amiga OS/Chip Ram set-up, it is not... Like I said, I like the Amiga... :)

PS and yes, TOS does load up, but I'm talking about
memory that is shown from the desktop is fully
available for use...! :)

: Only in your dreams! The Falcon is stuck on 030 technology and the
: graphics/video subsystem is outdated! This Phoenex is most likely
: overpriced as the Hades is. PowerComputing's PowerCenter
: 150(ppc604/150mhz) for $1499! Price includes CDrom, ethernet

Ummmm...no shit shirlock!
But tell me where I can get into any kind 16 track recorder for less
than a grand I'll buy it! I'm in a Falcon 030 running CuBase Audio for
a grand total of $700. I don't need video...it runs in black and white...
but by dammit, it work...and it works well.

I'm getting really tired of Sinclap comparing systems that came out only
a few months ago, to those that came out in what? 1992?

: > Falcon's are niche computers...and you better get used to the idea

: > because when Apple closes down, and it will, Mac's will only be sold
: > as niche platforms and nothing else.

BTW...I have a Falcon, and Pentium Pro...I really wanted a power mac... but was able to get into the two systems above for about half the money... plus, I can get local support that the Mac doesn't offer (as compared to the Pentium). Last time I shopped, the Mac dealers didn't seem to want to sell me one very bad...the PC guys were kissing my butt, and dropping the price another $100 every time I cocked an eyebrow. Also...the PC guys could tell me what they were selling me, how it worked, and were able to advise on what worked well and what didn't. The apple sales people just looked at me like "I was stupid" when I asked them if the system would run Cubase VST, or what speed processor different models had...etc. When I asked for Mac brochures, they said they didn't have any...and tried to sell me a copy of Mac World. The PC guys gave me enough literature on each system they sold to read for a month.

Apple has a great product...most likely the "SUPERIOR" platform...problem is...they don't care wether they sell them or not. The few dealers they have in my area are clueless, and have to tools become educated by.

As much as I hate to admit it...
Apple has a lot to learn from Intel and Microsoft when it comes to selling computers. 1...don't alinate your dealers, this is what killed Atari! 2...don't alinate potential coustomers.

Brian

: : :   16-bit Intel CPUs do have a 32-bit pointer, a far pointer (16-bit
: : :   segment + 16-bit offset). They are much less efficient than today's
: : :   32-bit offsets but they do work.
: :
: : You are incorrect. Apparently you've never programmed a 16-bit intel CPU
: : in assembly. Allow me to correct your mistakes:

: When "correcting" other's mistakes it would be helpful if you understood
: the topic.

I do, which is why I corrected your mistakes. I can recommend several books you might like to read, if you're interested.

: :   16-bit Intel CPUs do have a 20-bit pointer, a far pointer
: :   (overlapping 16-bit segment + 16-bit offset) ...

: In a 16-bit code segment a far pointer is a 32-bit data structure.

Perhaps in the 386 or later (I never had the misfortune of programming one of those in assembly), but not in a 8088 or 286. There is *no* way to access 32 bit addresses in those processors. If you have ever touched 8088/286 assembly, you'd know that.

: With
: respect to what is referred to today as real mode you are partly correct
: that the 16-bit segment and 16-bit offset are combined to form a 20-bit
: address. But this is a linear address, not a far pointer as you claimed.

In the 8088 assembly manuals, if you specify a segment other then the default, then this segment + offest *is* referred to as a far pointer. Near pointers also do the segment + offset to get the address, the segment coming from the DS.

So, it's not the fact that you did added a segment to an offset to get

an address that makes it near/far (the addition is always preformed),
it's what segment register you used (a "far" segment or a "near"
segment).

: Secondly, in 16-bit protected mode the segment is not combined with the
: offset as you described. The segment indexes into a descriptor table that
: includes among other things the base address of the segment.

This still doesn't get you 32 bit addresses on a 8088 or 286 (or any
other 16 bit intel CPU), which is what you claimed.

: Well you did manage to get one thing right

Which is better then you did...

How about the ZX Spectrum emulator that runs in Java on a web
page? I don't have the URL to hand, but it's the best use of Java
I've seen so far...

Indeed. The Acorn NC (and in fact *all* NC's that comply to Oracle's
specifications) contains a Java VM.

Can you point out anything on the web that shows how cool C++ is? Java is a nice language. But, it is just a programming language. It's not going to make your web page look like some Hollywood movie. From what I have seen of it, it is very well designed. Built in GUI elements, complete object-oriented design, many built-in objects, and it is close enough to C++ at it's bsic level to make it easy for me to remember the syntax. Corel has recently come out with it's productivity suite written in Java. i have doubts about the speed of such a thing, but then I am using a 90 MHZ system in a world of 500 MHZ systems. I would look for PCI cards with an actual Java machine on them to start showing up soon. This would allow Java to run native on it's own processor. I would also expect to see more actual applications (as opposed to applets) being sold. There is a huge gain to be made if you can just write one version of a program and let anyone use it on any platform. Just think, no more "You can't get any software for the Mac"!

Well this is a joke, I ran AmiOZ BBS for over 10 years on a A2000 with a
C= 7 port serial card, it worked great all that time.

I was & still am a big fan of the Amiga, it took a lot to change me to a
PC, Windows95 was the main one as it is much like using a Amiga,
somethings are missing like pulling down the screens to get at programs.
but all in all win95 is good.

The fun thing about all this mac v PC v Amiga is this Amiga that is
talked about is near 10 years old, I was using a A1200 long before it
hit the shops. it was great then, but the PC has court up, only because
the Amiga stop getting new hardware/software.

The Amiga was talked about being used in settop boxs back in 1990, so
maybe Gateway will use it in Internet settops, using a browser in rom.
the cost would be very little to make, using a box like a CD32.

Gary Colligan

Do you have a car?

Do you like music on the go?

Have you given any thought about upgrading the car stereo system?

If you have answered yes to any of these questions,

Go to http://www.j51.com/datamax/prod01.htm

Guaranteed, I can save you a great deal of money.

Sincerely,

SP, Woodring

You make a grown man cry. I never had an Amiga, until i compiled the
Unix Amiga Emulator on my machine. I instantly liked it.

Hell that Baby can do REAL multitasking. Win'95 can't.
You've just downgraded.

Tom Kennedy (tomk@fc.hp.com) wrote:
: Anthony D. Tribelli (adt@netcom.com) wrote:

: : When "correcting" other's mistakes it would be helpful if you understood
: : the topic.
:
: I do, which is why I corrected your mistakes. I can recommend several
: books you might like to read, if you're interested.

Assuming you've read them once, I suggest re-reading them. :-) You seem to
be having a little confusion with near and far pointers (something a
program operates on), linear addresses (what the CPU derives from a near
or far pointer), and a physical address (what the CPU puts on the address
bus).

: : In a 16-bit code segment a far pointer is a 32-bit data structure.
:
: Perhaps in the 386 or later (I never had the misfortune of
: programming one of those in assembly), but not in a 8088 or 286.

Wrong. A far pointer is a data structure that has a segment and an offset.

In a 16-bit code segment it is a 32-bit data structure, in a 32-bit code segment it is a 48-bit data strcuture:

> When using 32-bit addressing, a logical address (or far pointer) consists of a 16-bit segment selector and a 32-bit offset; when using 16-bit addressing, it consists of a 16-bit segment selector and a 16-bit offset. [Intel Architecture Software Developer's Manual, Volume 1 Basic Architecture, 1997, p. 3-5].

: There is *no* way to access 32 bit addresses in those processors. If
: you have ever touched 8088/286 assembly, you'd know that.

No one said you could. You're confusing far pointers and linear addresses. A native far pointer does generate addresses that span the entire address space of the CPU. For example a 32-bit pointer on a 286 in protected mode generates a 24-bit physical address, similarly a 32-bit pointer on a Motorola 68K generates a 24-bit physical address.

: : With
: : respect to what is referred to today as real mode you are partly correct
: : that the 16-bit segment and 16-bit offset are combined to form a 20-bit
: : address. But this is a linear address, not a far pointer as you claimed.
:
: In the 8088 assembly manuals, if you specify a segment other then the
: default, then this segment + offest *is* referred to as a far pointer.
: Near pointers also do the segment + offset to get the address, the
: segment coming from the DS.
:
: So, it's not the fact that you did added a segment to an offset to get
: an address that makes it near/far (the addition is always preformed),
: it's what segment register you used (a "far" segment or a "near"
: segment).

A far pointer is just a data structure, not an operation of any kind. It is part segment part offset, usually in memory, but sometimes a register pair like DS:SI, ES:DI, SS:SP, or CS:IP.

: : Secondly, in 16-bit protected mode the segment is not combined with the
: : offset as you described. The segment indexes into a descriptor table that
: : includes among other things the base address of the segment.
:
: This still doesn't get you 32 bit addresses on a 8088 or 286 (or any
: other 16 bit intel CPU), which is what you claimed.

No, you misread and/or misunderstood. I claimed a far pointer was a 32-bit data structure. I only claim that a far pointer can access the entire address range of the CPU.

: : Well you did manage to get one thing right
:
: Which is better then you did...

I suggest re-reading this post and my last post.

Tony

I'm terrible at drawing, but maybe someone could do something with this:

A Windows-like logo with a brick imprinted "Linux" smashing or just
having smashed through in full flight.

Perhaps the fracture pattern could be remeniscent of the MIT "X" cursor.

Actually, make the brick's imprint any one of many OS's - have one of these, drawn somewhat differently, for each non-MS advocacy group.

News flash!

There is new hope on the horizon for the Amiga! Gateway 2000 has just exclusively purchased ALL of the rights to the Amiga.

As of this time, I don't know what intentions they have, but as a multi-billion dollar corporation (albeit one that I havn't admired much in the past) they have the potential to develop the Amiga into the system it deserves to be.

Time will tell. So far Gateway 2000 has been married to Intel and Microsoft (to put it quite mildly), but perhaps they realize that a true independent identity is a more secure way to stay successfull? Lets hope they don't just shelf the Amiga for good. A dark and sinister side to this might just be that they want the Amiga to go away permanently, and what better way than to buy it and then shelf it!

Man's mind is his basic tool of survival!

The Falcon can be upgraded to 040, don't know about 060. Likewise with the
graphics. And don�t forget that the processor is backed up by coprocessors like
the Blitter and DSP.
Centek say that the Phoenix will be cheaper than the Hades.

Why would you need that hardware if you're into music? Cubasis certainly doesn't
need 24-bit graphics. It needs MIDI. Other programs need sound ports, which the
Falcon also has.

Oh, come on. I really don't think anyone "ignores" a segfault (or equivalent). Since the program is terminated by the OS, it is difficult to ignore. It is merely more convenient not to have to reboot a hung machine; one has a much better chance of locating the bug quickly. Especially if the machine is doing anything else important or useful at the same time, as computers with proper operating systems are apt to be doing. Oh, wait, personal computers don't need multitasking.

>>But most embedded computers are not memory protected. They use the
>>different approach of Watchdogs or similar precautions.

Well, actually, quite a few embedded applications have the ultimate memory protection of running code (text) directly out of ROM. Other systems have physically separate program and data memories (Harvard), possibly of different speeds or widths. But yes, that's different from an MMU. Some embedded systems use one of those, too.

Fine, if it works..But there are others who need internet capabilities
and their current Falcon's don't cut it!

"Sinclap," I am not surprised that you haven't responded to my post. I believe we have reached the point in the discussion where you have been proven wrong with clear numbers and clear logic, and all you can do now is either ignore my post or admit that you are incorrect.

I have a dream. One day, you'll prove me wrong about you and actually ADMIT you don't know a damn thing about audio/MIDI on computers. You'll actually come out as a respectful human being and state, for all to see, "I don't know how the Falcon compares to the Mac as an audio/MIDI platform, since I've never used either to create music or edit audio." In this dream, you will become educated to the ways of audio, and will have a revelation. At this point, you will agree "Yes, the Falcon is a good MIDI/Digital audio platform.. no, not as feature filled as the top Mac or PC solutions, and there aren't as many pretty graphics, but it is as well integrated as the top Mac and PC solutions, and costs less money for a pro system." Of course, you will still stay a Mac user, but you will realize that there ARE merits to other platforms other then the ones created by your heros Jobs and Wozniak.

Alas, it's only a dream..

I would never presume to argue with you about, say, whether an Atari, Mac, PC, or SGI machine is better for 3d animation... because I've NEVER DONE IT. Would you criticize a politician for their views on something without researching it? I think not. So, prove me wrong and display that you are a real person.. admit you are incorrect about this.

-Mark

OK, but tell it to StarDivision. They made a relatively clever choice ---
implemented the core engine in C (or whatever) on a selected number of
OSs, and wrote a Java front end for it, running on whatever you care to
run it on --- and the front end can take care of a fair amount of the
non-CPU intensive work. Every test so far says that it is amazingly fast.

Bernie

      Shhhh! Don't spoil all the fun for all of us that have been using
      the net since the ST...

      The Falcon has more than enough horsepower to deal with what can
      travel down the typical PPP line.

      Wake us when bandwidth catches up...

  Hmm...I like the Amiga and it did have some definite advantages but I would
  not go so far as that... It did have a slower processor speed. It didn't have
  a hi-res monochrome display at first, it was initially much more expensive,
  etc,... Oh, also (and feel free to correct me if I'm wrong here) but a 2 meg
  Amiga A1000 in 198X with 512k of Chip Ram could -not- load up a 640k picture
  or MOD into memory, is that right?

  I'm not even covering the MIDI advantages... :)

If you're willing to give Linux a try, there is a window manager available named "amiwm" that is supposed to emulate the look and feel of the amiga, complete with multiple, draggable screens. Check out:

http://www.plig.org/xwinman/amiwm.html

I cannot vouch for the accuracy of the above, but assuming it's true...

I suppose if you're a supporter of increased restrictions on firearms ownership, you should buy MS stuff. If you're a proponent of firearms ownership rights, you should shun MS.

Regards,
Jim "no surprises here" Seymour

They won't just shelve it, that would be a waste of good money. I think gateway just saw a bargan-basement deal on some great technology, and snapped it up. Expect to see all those custom Amiga chips soon... in a Windows-compatable Gateway computer near you!

Why on earth do you have to be a gun ownership rights advocate
to shun MS? There are plenty of reasons to shun MS that are
actually related to what MS does on a day to day basis. What
Billy chooses to put his own personal money into has nothing
to do with his company.

If you're going to bash MS (a worthy pasttime), then do it right.
Bash them for the stuff MS itself actually does. Trust me, there's
no shortage of things to complain about.

The only reason MS is popular is because the average computer buyer
doesn't know diddly about computers.

Now THAT is a stupid statement. Gun ownership has nothing to do with microsoft products. It's completely immaterial whether or not Bill Gates likes guns. I believe that the sales of all guns should be outlawed. And I dislike and will not typically use Microsoft products. The two opinions are completely unrelated.

You should rewrite your comment as :

If you are a supporter of increased restrictions on firearms ownership, support causes that believe firearm ownership should be restricted. If you are a proponent of firearm ownership, support causes that support firearm ownership. If you find Microsoft products useful, you should buy MS stuff. If you dislike Microsoft products, you should shun MS.

And then you should take your gun comments to a different newsgroup where they are more appropriate.

I'd be suprised. Graphics and sound have moved on a bit - the architectures in some of the PC graphics cards are truly awesome: puts the amiga into perspective. As for sound.... well, when synth manufacturers make PC sound add-ons, you know they're good.

Zig Zag wrote:
> Java is a joke!

Well, if it's *real* Java applications you want, then there are a few examples available. HotJava is a fully functional web browser written in Java by Sun - the first large Java application to be written. Sun have also produced an IDE for Java in Java, called Java Workshop.

Borland's AppExpert and Debugger for Java are both written in Java.

There are at least two WWW servers available written in Java - Sun's Java Web Server (aka Jeeves) and the World Wide Web Consortium's Jigsaw.

Corel Office for Java (including Quattro Pro and WordPerfect) was available in pre-beta form the last time I checked, though it may have moved on considerably since then. And Applix's Anyware Office is available now, and includes a word processor, spreadsheet, e-mail client and business graphics package.

Your suggestion that Java is a joke might surprise all the companies that have produced Java IDE's, including Microsoft, Borland, Symantec, Rogue Wave, Asymetrix, Metrowerks and others.

Finally might I point you at a URL which might give you a little more information: http://www.sun.com/javastation/customersuccesses/ which gives details of large companies that are using Java (and more specifically, Sun's Javastation) and certainly don't seem to think it's a joke.

Oh, and in future get a clue before posting that sort of offhand dismissal of something you evidently don't know much about. I'm sure you're not particularly impressed when people post 'Amigas are crap and outdated' to all the c.s.amiga newsgroups, so there's no excuse for you doing the same thing.

Adrian

I presume Microsoft funds gun control groups, considering Bill Gates
politics, just like credit card companies like MBNA have funded
Handgun Control Inc. $25,000.00 before. Why not switch to companies
that don't fund odius political groups, or any groups at all?
Corporate funding of political groups and "charities" has had nasty
results, such as the corporate funded ruin of NPR and PBS.

All computer users should be required to have a seven day waiting
period before buying from Microsoft.

Everyone should be allowed to own disk reformatters to protect
themselves from Microsoft's New World Order.

(besides, if I'm pro gun control, does this mean I'm supposed to like
bill? Gack)

Actually there's a strong relationship between guns and M$ products: they
are both dangerous for people's well being.

Hmm... yes. It is no longer "power with out the price", It is more like
"power with the price". I've seen and 'played' with a DirecTT60, and it
is
obscenely fast, makes me sick when I am at work on my 166MHz Pentium
w/32
MB RAM processing images. My work machine is just not as fast, as
capable
as the DirecTT, not by a long shot,whether running Windows3.11,
WindowsNT.
Now maybe if there were good DOS graphics programs, it would be a little
closer. If I had a DirecTT60 at work I'd be spending more time drinking
coffee than making it! :^) It is not cheap[2800U$A?], but I don't really
know if
there is "anything" faster in the PC world. maybe a 250MHz Pentium Pro?
And how much is that? about the same price?
so for the money Computer Direct is asking for, it is reasonable - for
professionals only though. The home/hobby buyer would not be interested,
and quite frankly has no use for such a powerful machine. Perhaps the
same
logic would apply to the 533MHz PPC's?

> All sentimentality aside, the reasons most Atarians originally rallied
> around the ST, etc. just don't apply. If you want obscene amounts of
> raw horsepower, rock solid stability, ease of use and an endless supply
> of apps, all at a decent price, you've got to grab a Windows '95 machine
> today. These things essentially have the kind of intrinstic buyer appeal,
> now, that Atari had in its day.
>

the endless supply of apps is a ridiculous argument, in fact it works
against
the PC world as there is so much code that is rushed to market to 'beat'
the competition (i.e.CorelDRAW) that the user is stuck with beta
software
I haven't found anything like Edith in the pC world, maybe I never will
(although Annius is working on a unix version). It's been said before,
but
I will say it again, who cares? how many word-pro apps do you need, or
use?
how may graphics programs? image processing programs? MIDI programs?

Obscene amounts of raw horsepower - yes. the only time you see it in
action
is when you run it in DOS, cuz Windows takes so much power just to run.
For
example, as an illustration of my point I have TurboCAD for DOS, and
TurboCAD
for Windows. I never use TurboCAD for Windows anymore because it is a
pig,
dead in the water. TurboCAD for DOS runs faster on my 386 without a
math
co-pro than TurboCAD for Windows runs on my Pentium. You need that power
just to get off the runway. Incomparison my Atari is like an ultralight!

:^)

Rock solid stability? Maybe for NT4, it looks pretty good. OS/2 is not
so bad
either. Win95? ehh, I've heard and seen conflicting stories/examples.
Win3.1
is dog meat.

Ease of use? Well, I am involved in the training program at the college
here,
and we have to train people to use Win95, it ain't simple and easy to
use,
unless you _only_ want to turn it on, play games, turn it off. Which is
perhaps the level most home users are at, which is all right, that's
probably
all they bought if for. It's all my friend bought it for.
$2,000 to play Duke Nuk'em.

Intrinsic buyer appeal? that's a very truthful marketing statement. :^)

> If you keep your Atari today, do it for nostalgia purposes or acknowledge
> that you like it because it is quirky and cute, but anyone who claims that
> "Atari rules" probably isn't being very honest with themselves.

I don't claim Atari rules. You are putting your words into peoples
mouths here,
just to make a strawman you can knock down. go ahead - knock him down.
feel better :^D
Nostalgia? quirky and cute? I suspect you've never used an Atari
professionally.
>
> I agree with others that, if you have to get a non-Atari machine today to

> itself in the Mac arena (too bad in both cases - and I state this sincerely).
>

Oh I am sure you are sincere.
for 'decent'(?) access to the web you either need a PC, a MAC, an Amiga,
or
an Atari, maybe an ARM? how about an 8bit Atari? what is 'decent'?
MAC on the way out?
-Webweek 7/10/96 "MAC #1 in webauthoring, 41% market share worldwide
-Lightstone Thompson 1995 84% of most poplar 50 CD's developed on the
MAC
-Dataquest 1996"Multimedia Market Trends" MAC #1 multimedia vendor in
world.
18.8% market share
-Computer Intelligence, 5/3/97 MAC os market share increased by 61.4%,
XXX86
market share decreased by 5.1% over previous year. MAC os market share
8%
in 11/96, 11% in 1/97.
-Griffin Dix Research Assoc. 1996 MAC #1 in Colour Desktop Publishing

with 80%
of market share.
-Georgia Inst. of Tech [macworld 11/11/96] MAC #2 web server in
world(after UNIX)
oh yes. _obviously_ MAC is on the way out.

> Most folks who would rather die than own a PC fall into two groups. First,

> anything
> which is too mainstream (people in this group usually have their biggest
> problem
> with Windoze and/ or the market dominance of Microsoft - proverbial Bill
> Gates
> Haters).

I admit to both bias. I also admit that I have owned PC's since 1982,
and I
am sick to death of them. I own a 486 now, and the god damned headaches
(i.e. have you ever tried to get two different IDE drives to work
together?)
are just not worth it. From my _experience_ MAC and Atari hardware is
far
more reliable, SCSI all the way. Of course you can buy a decent SCSI
card
for the IBM too. I know that, but I'd rather use the 200$ for something
for my Atari!

what are you talking about? I somehow don't have access to hardware and
peripherals because I have an Atari? Gee, I thought my memory, SCSI hard
drives, microphone, Multisync monitor, etc were ordinary peripherals, I
guess I'll have to check for the Atari label when I get home! What
platform restrictions? Geez, when was the last time you owned an Atari?
1992?

You are probably quite correct in your last statement. Are you born
again?
PC's are the light, the way, and the truth? Have you 'embraced' the PC?
My Atari does what I need to do, quite well, inexpensively, and I enjoy
it.
You have your 'opinion' and that's fine. so why are you trying to 'save'
me?
why are you trying to convert anyone? Will converting someone somehow
validate your choice? of a friggin _computer system_??! :^D
ROTFL!

The ST is 16 bit... Frank is talking about the relatively old Atari XE etc!

No, but there was a custom cable designed for use with Darek Mihocka's 8-bit emulator on the ST. I can't remember Darek's e-mail address, but his company (which markets 8-bit and ST emulators for the Windoze) is called Branch Always Software (BRA-Soft) and is on the web... perhaps he still sells these cables?

Actually, he's changed the URL to

www.emulators.com

and the company is now known as

Emulators Online

His company is now called Emulators Inc.  I wonder if Darek works for
MS, he is in the same neighborhood.

He was hired by Microsoft right out of college years ago, and he was
still working for them when I met him about 18 months ago. So he's
probably still there.

Thanks, I knew about ulimit (on AIX, haven't yet put up linux). The
problem is, its not good enough. In AIX the hard lower limit is 40
(Yes I've screamed at IBM). Likelwise minima for stack and heap
sizes still let it run. And of course by no matter how fast I kill
one process new ones are created before they're all extinguished.
(yes I've refined it to a single pipeline'd command to try and get
them all in one swat). May be big iron prejudice on my part, but
this is ridiculous - a single non privilidged user should *NEVER*
be able take up that much of the machine and/or be unstoppable.

Just asking. In many ways I've come to consider unix superior even to the mainframe OS's for program development. As indicated I intend to put it on my PC at home -way better than MS! But from the mainframe world, this "feature" just seems intolerable in a multi(real)user system.

Unix needs a faultless way to limit or kill process by uid/gid/load-module name and about any other categorization. I don't know if this is mere oversight or (as I suspect) a "flaw"/"feature" of the unix program paradigm. (translation: I'm a relative newbie to *ix, not a seasoned prog'r - in unix).

Constructive thoughts very welcome. Thanks again.

It's amazing how quickly you get used to the power of UNIX/X
systems. Until someone pointed it out to me I thought nothing of
overcoming the lack of an Emacs on one set of computers (physics) by
logging into another (CS or AI) and executing Emacs there. I expected
to be able to execute programs on remote computers and have them come
up in a window on my desktop the same as local ones.

Kaz> There is plenty of commercial software for it. I have even

Caldera (http://www.caldera.com/) is the Linux CDE.

Work smarter, not harder.

Use SIGSTOP to stop all the processes, and then kill them. If

they are not all killed at the same time who cares .. the rest
cannot fork since they are stopped.

] May be big iron prejudice on my part, but this is ridiculous -
] a single non privilidged user should *NEVER* be able take up
] that much of the machine and/or be unstoppable.

a non-priviledged user .. isn't that a contradiction?

I'm working on an event simulator, why should I *NEVER* be
able to take up 100% cpu time? Or I'm writing a parallel program
using PVM (parallel virtual machine) library, why should I not be
allowed to have 40 processes working away?

]   Just asking. In many ways I've come to consider unix superior
] even to the mainframe OS's for program development. As indicated I
] intend to put it on my PC at home -way better than MS! But from the
] mainframe world, this "feature" just seems intolerable in a
] multi(real)user system.

Well now you can have an even better opinion of unix, since you
know how to kill the runaway processes now.

]   Unix needs a faultless way to limit or kill process by
] uid/gid/load-module name and about any other categorization.

Use ps & shell script. Send SIGSTOP first, then SIGKILL if
you have some kind of fork problem.

Like I have a shell-function 'tkill' that takes text as a
paramter and kills processes with that text in the output from
'ps awx'.

] I don't know if this is mere oversight or (as I suspect) a
] "flaw"/"feature" of the unix program paradigm. (translation:
] I'm a relative newbie to *ix, not a seasoned prog'r - in unix).

It you can write a shell script to do it, isn't that good enough?

]   Constructive thoughts very welcome. Thanks again.

Thanks!   This is exactly the solution I needed for this kind of problem. fwiw, even the IBM people in Texas - at least those in cussing support - never even came close, but this ought to work. My only remaining question is why this isn't plastered everywhere - several books I've read mention the for(;;)fork() problem, but this is the first I've seen of a viable solution (or maybe I just missed some broad hints - I said I was a relative newbie. Thanks again!).

most Linux distributions call it killall(1). beware: Solaris has a
very different beast by the same name. the Linux implementation lets
you, for example, kill all processes with a certain name, or belonging
to a certain UID. the Solaris one kills _all_ processes, full stop.

|    | `-+-        |     |   \  +--- +---  BANNER CONTEST
```

Hi,

Would you like to promote a Microsoft-Free world?
Are you proud of running your web site free of Microsoft stuff?
Ever wished you could win prizes just drawing a nice banner?

Here's your chance to do all three at once - enter the Petitmou Banner Contest!

The winner's banner will be provided for free to the Internet community so anyone can put it on his page. Hopefully, this banner will show up on lots of pages and the web will start wearing a uniform Microsoft-Free logo.

Do not hesitate anymore, and start drawing your banner.

    * Click here: http://www.petitmou.com/contest.html *

==

The idea we had about the contest is to define ONE unique microsoft-free banner (which could be yours if you win the contest). Just like Netscape and, microsoft has their banner (which appears everywhere), we think we could benefit in a unique microsoft-free banner. With a unique banner showing up in many places, we have a better chance to impact the web surfers. Promoting an idea is better served when you have a recognizable logo.

That's why we think we think you should join us, put a link to the contest page (as described in my previous mail) and draw your banner or badge for the contest.

==

To promote the contest, *** add this text in your homepage *** :

```
<!-- BEGIN MICROSOFT-FREE BANNER CONTEST CODE -->
<a href="http://www.petitmou.com/contest.html"

Oh my God! And all this time I've been thinking that programs that use
the modem might need to configure it, with commands like
"ATE0V1Q0&B0...", and which Microsoft Windows 95 does a pretty good job
of detecting automatically, even on pre-PNP modems.

(BTW, I run Linux 99% of the time, but the fact is that MS has done some
good things in W95, and autodetecting modem init strings is one of
them.)

YMMV,, Win 95 detected both my modems, and i was reasonably impressed,
BUT it got them BOTH WRONG. (G). I stopped being impressed at this
point, because the fact that both of them existed in the database of
modems, yet win 95 still got them wrong was pretty pathetic. If something
is offerring to make a decision for me, I'd expect at LEAST a 50% success
rate, after all, I have the ability for a 50% success rate on any
decision. (i.e. right or wrong). So, 0 and 2 didn't particularly instill
confidence in me.

Weeeelllll.... my gateway comes with a gateway telepath modem, which
really is just a USR sportster 33.6. So I don't exactly freak out when
it doesn't recognize the USR as a gateway, despite the fact that gateway
is in the database.

Have you seen the person formerly known as Sinclap, who spouted out about audio production on the Mac vs. Falcon without actually knowing any facts? His argument was simply destroyed in this newsgroup.

Of course, he NEVER RESPONDED. I would be happy to repost if he would be interested in responding.. but in order to do so, he would have to confess his lack of knowledge, something it seems he is unlikely to do.

Now this post was just a test too.. :)

Subject: GateWay2000 Makes Bid for Amiga Tech.
Date: 1997/03/30
Message-ID: <5hkog4$l7c@service3.uky.edu>#1/1
X-Deja-AN: 229374513
Organization: University of Kentucky Computing Services
Reply-To: bsrowe00@pop.uky.edu.nospam
Newsgroups: comp.sys.atari.advocacy

The wires and IRC are buzzing today with the news that GateWay 2000, the successful PC maker with the cow-colored boxes, has put in a successful bid for Amiga Technologies. Their press release has appeared on yahoo, and is now on the main entry page at Amiga Tech's own site at www.amiga.de.

The press release reports that Hembach, the German court-appointed Administrator of the sale of Amiga Tech, has accepted G2000's bid and that it is now subject to "regulatory approval."

For those of you not familiar with Gateway 2000, they are located in South Dakota, USA, and run a lot of tv advertising here, often whimsical, with an attitude, playing off their fondness for black and white "cow colored" graphics.

Good news for the Amiga faithful is that their press release says:
>"This acquisition is good news for Gateway and customers of AMIGA,"
said Rick
>Snyder, president and COO of Gateway 2000. "It will strengthen our
>intellectual property position and invigorate a company that has been a
>pioneer in multimedia solutions and operating systems technology."

Gateway 2000 has 9700 employees, and grossed $5 billion last year.

What this portends for us is manyfold - a well-respected hot selling computer company making Amigas could easily attract back the big-name software houses.

Things are finally looking up :)

I wonder if people who comment of the Newton's hand writting recognition accuracy have used one for any length of time. People do realise that it uses a neural network to learn how to recognize an individual's writting and you probably have to use it a week to fully train it, right?

Seeing as it was me that said it yes I have used one at length I was
unfortunate to actually buy the bloody thing and have been trying to
sell it for the last 6 months.

Which one did you buy? And you know, I bet that we could form a company that develops software that looks at people's sigs and decides what changes need to be made to their email address valid. We could sell it to those internet marketing companies and make a million bucks.

>What do you mean by that? The IBM PC was open? Was it possible to install any
>kind of hardware and software? Motorola processors, Amiga Operating system, etc?

Yes, it was. The PC was open because IBM used off the shelf parts. The biggest being the Intel 8088, which anyone could buy. Compared to, say, an S/36, the PC was about as open as you can get. And I *have* had a Motorola 68000 in a PC, back in 1982, in an add-on card.

>Probably not, the IBM PC was a closed solution, which became a de-facto

>two/three years ago.

Yes, capacities still increase. But tell me, if you don't consider the PC to be open, what *DO* you consider to be an open machine? The Mac? The Amiga? The NeXT?

>The PS/2 is not dead, because it was closed, but because of the bad maketing of
>IBM (same as OS/2). If Bill Gates would have taken care of the PS/2, then
>believe me most people would use microchannel architecture PC's.

What did Gates have to do with the PS/2? The MCA did not succeed not because of software (OS/2 ran just fine on it, in fact the ABIOS on the PS/2's helped it quite a bit), it died because of outrageous hardware. Try to buy a sound blaster, a modem, or even memory for an MCA box and you were looking at anywhere from a 50% to 100% increase over the ISA version.

>And which owns the bigger market share? DOS/Windows you find EVERYWHERE, for
>UNIX you need to go into an academic environment or some highly IT-specialized
>companies doing highly IT specialized stuff.

Not surprising, that's what it was designed for. Unix was not written for home consumers; Windows was. Likewise, Windows is not suited for the industrial strength applications that Unix revels in.

Did you notice the accuracy going up or did it never recognize your writting
at all?

Win95 detected my internal modem. It got it right. It had previously
detected the SB16 PnP and the plug and play installation was exemplary.

Then it detected a new 3COM PCI NIC. It detected it alright, then
proceeded to give it the *same* IRQ settings as the internal modem. A
few hours later, I gave up in frustration and just overrode all the
settings and installed the card manually.

Rgds,

Chris

"Devant le comportement irrationnel de sa machine, j'ai compris que se poser en dfenseur de Windows releve de la plus profonde bassesse. J'ai honte" --- Eric Bernatchez, "La Presse" newspaper, "Cyberpresse" column, March 22, 1997, Montreal, Canada.

"Confronted with his machines irrational behaviour, it dawned upon me that taking the position of Windows advocate is of the lowest possible ethics. I am ashamed".

Erm, he didn't say otherwise. He said the ST is old, not 8-bit.

It certainly DID get better but never got any faster or particularly
accurate. IF you print then it's recognition is quite impressive,
cursive is OK at best.

The MessagePad 2000 probably gets rid of the speed problem. I don't know
if the accuracy has been improved.

Respect and admiration of your peers are important features when buying a
computer?

All the best,
Chris @ Computer Direct

I never stated the Mac did audio better or worse. I stated that the Falcon does it better for the same amount of money.

> No lack of knowlege here. Just the market facts..

If you had the market facts, you would not have posted the drivel below. Please see the post I made in response to you, that you never had the courtesy to respond to. I will assume you were having some kind of 'ISP problems' (heh, heh) and didn't have the chance to see it the last time around.

Don't be such an idiot. I work on Macs daily, including said 6400.

On the other hand, just how much experience do you have with the Falcon? Have you ever edited digital audio on one?

Also, I'm talking about OVERALL audio performance, not just processor speed.

> The Falcons are stuck with antiquated 030 processor that needs a DSP.. All
> this audio inputs and outputs can be added to the 6400 and still be cheaper..

See, you have NO CLUE what the FUCK you are talking about. I am a Professional audio editor and musician with over a decade of experience in digital audio. You know nothing about the subject. Pro Tools Project is the least expensive currently available Mac system that offers 8 outputs and 8 inputs. It is around $2,500, NOT including the computer. The Korg card, which offers only 2 inputs and 2 outputs (but is expandeable to 8 inputs and 8 outputs for another $1500) is $1200 itself. That's all there is out there, moron. I will assume you have spent a little time in math class, so I'll let you do the math yourself.

> Source please.. The reason the 6400 does not have a dsp is due to the risc
> PowerPC.

Which I alluded to, but you cannot use effects that were written for a DSP chip (like all DIGIDESIGN effects) on the PPC without a Digidesign card. Yes, some are being re-written, but they haven't been yet.

> And you have evidense that the Falcon has better timing? What if the musician
> wants to do other tasks besides midi like web page creation, and having the best
> internt tools?

Yes, I do. There have been a couple of articles written in european music magazines that deal with this question. Try searching the archives of Sound On Sound if you really want to know.. and I trust you don't.

Also, because of the way the Mac handles digital audio via its inputs, there is a slight audio delay when recording new audio while listening to previously recorded audio, especially when VST's real time effects are used. It's not a huge delay, but it's something to be aware about.. if you're recording timing critical audio, it might interfere with your groove.

Nice try attempting to change the subject. The issue is AUDIO tools, not WEB tools or word processing.

> > I will say I've had far more crashes on my Pro Tools III system
> > at work then on my Falcon at home..
>

> PowerTools III system? Must be a Mac clone firm. I would check with your extensions to make sure none are conflicting. That should solve your crashing issue..

Now, you've demonstrated your complete IGNORANCE of the audio world. Pro Tools III is a Mac based digital editing system.. THE MOST COMMON ONE IN THE WORLD. If you don't know what THAT is, then just shut up about audio on the Mac. You're clearly talking out of your ass.

> Heck I can get new refurbished PowerMac Performas 6116 for $599 with a 90 day Apple warranty. Price includes keyboard and CDROM(option and extra cost for Falcon).

Sure.. you could. But the same audio input/output issues apply. If you're buying it for audio, who gives a damn about CD-ROM?

> The Midi market has standarized on Mac/PC. I hardly see any mention of the Falcon as a midi station.

And you've already demonstrated your ignorance of the market by not even knowing what a Pro Tools system is. Truthfully though, the Falcon is not very popular compared to Mac/PC. But I'm not buying a computer based on a popularity contest, it's how well the computer does what I want it to do. It does, for less money.

> I bet that Cubase Audio VST/Mac system out sells a Cubase Falcon one. So your asertion is that Falcon will remain viable due to cheaper expansion options? Do you have proof?

Yes, Cubase Audio VST clearly outsells a Cubase Falcon.. it seems like a system with excellent potential. I'm making music NOW, not waiting for potential.

It eventually will be a better bargain then a Falcon. I don't know whether the Falcon will remain viable or not.. I just know it IS now, I can create without limits right now. That's all I need to know.

I already gave you proof, I gave you model numbers and prices. You gave me a bunch of hot air and demonstrations of your ignorance.

You already have a Mac, you know little about the Falcon, and even LESS about digital audio production. Tell you what.. I won't speak out as an expert the Mac computer if you won't speak out on ANYTHING that has ANYTHING to do with digital audio production ON ANY FUCKING PLATFORM.

Yes.

Just like "muscle" cars, computers can get you respect and admiration from
your peers.

And this especially applies if you suffer from LDS (LittleDickSyndrome).

Many of us can probably name one correspondent in comp.sys.atari.* that
probably falls into this category, who has just come back to us after a
hiatus.

Won't work. A process can't fork if it's dead, either, which is exactly what it'll be if it receives a SIGKILL.

No, the real problem is that the processes are continuing to fork new processes as you're in the process of generating the process list, so your process list isn't likely to be comprehensive.

What you *can* do, though, is send the signal to the process group. You specify a negative pid to do that. For it to work, though, I believe you'll have to figure out the process group ID associated with the processes and kill that. 'ps -j' will do that for you under Linux.

Naturally, that doesn't help if the new processes being creating each set themselves up in their own process group.

I just bought a Falcon. It's a great machine. You don't have to worry about the OS falling apart. With Windoze 95.....*sigh*

But I'm outnumbered. All my classmates have PC....me too, but they pick on anything that isn't PC or Tinysoft. MAC....well it's a capable computer, It's better than the BC....uhh, sorry PC. But I have had the worst possible software failure on the BC. When i tried to access a CD, Windoze crashed. When I play games, I run out of memory (16Mb).

I NEVER HAD THAT SHIT WITH ATARI!!!!

Atari is like a Phoenix. It may die, but is always reborn.

]
] Won't work. A process can't fork if it's dead, either, which
] is exactly what it'll be if it receives a SIGKILL.

.. but what's left of the other processes *can* fork.

This answer was in the context of a 'for(;;)fork();' loop -- a condition where processes never exit. Most unix now can limit a user to a fixed number of processes, say 40 are free.

The fork() bomb quickly fills in these 40 slots. Each of the 40 processes continually calls fork() and receives EAGAIN *without* creating any new processes.

At this point the process IDs are stable; no new processes are being created/destroyed. If you kill any of them, the unkilled ones will quickly fork() more to fill up the 40 slots. You can't kill all of them at once since kill() only sends signals to 1 process at a time.

But if you *SIGSTOP* them then they all still exists as processes, so there are no new slots for not-yet-stopped processes to fork into. *All* the processes will be stopped, even though stopping them all isn't an atomic operation.

Then if you kill any of them there are slots to fork() into, but all the fork-bomb processes are stopped (SIGSTOP cannot be caught or ignored).

] No, the real problem is that the processes are continuing to
] fork new processes as you're in the process of generating the
] process list, so your process list isn't likely to be
] comprehensive.

Not in the example Terrence gave, but it can be the real problem. Take this diabolical fork-bomb that I just now thought up:

```
   main() {
      for(; random()%3; ) {
         if (0==fork()) srandom(getpid());
         setpgrp();
         }
      }
```

Ouch, that hurts! The random part says with 0,1,2 fork on 1,2 and exit on 0. So, on average it'll fork 2 children and exit. So we have it growing processes .. *but* when it hits the 'wall' the current processes will die, leaving space for others to fork into. This way there are no constant PIDs that you can use in order to send SIGSTOP to. However, by repeating the 'stop' part of 'stop then kill' until by luck you get them all might work.

(we need to seed the random generator, since otherwise all processes would use the same sequence, so when it got to a 0 all of them would decide to exit)

And of course, the mother of all fork-bombs has the parent exit after a while, like above. But before it does it calls wait3() to find any children in a stopped state, so it can restart them (or better yet kill them, since their PID is already known).

If you are root, you can set a CPU-eating process or two at a high priotiry and then at the next higher priority use the stop and kill method and it'll probably work better...

The stop & kill should work perfectly with all *honest mistake* fork-bombs. If one of the above is used, the final solution is to kick the bum off the system (and get the company lawyers to harass him) ;-)

] What you *can* do, though, is send the signal to the process
] group. You specify a negative pid to do that. For it to work,
] though, I believe you'll have to figure out the process group
] ID associated with the processes and kill that. 'ps -j' will
] do that for you under Linux.

Sounds like that will usually work, but only:

] Naturally, that doesn't help if the new processes being
] creating each set themselves up in their own process group.

Right, it is not going to work every time.

With the new, 300-MHz entry-level systems from Apple coming out the door, a PowerMac with MagicMac is probably the best way to take TOS into the 90s!

Why, oh why, can't some small, daring company buy the rights to TOS, grab a CHRP board, license 68K emulation from Apple, throw a bunch of generic sound and graphics chips on the CHRP board, add in a PPC-native TOS, and sell it as a low-resource computer? It would be a fantastic value! It would also offer the security of being able to run MacOS 8, 9, and later, X.

I see Mr. Sinclap has returned to accurse the TOS groups with yet more "expansive Hades" stuff. <sigh>

Yes, but won't a killed process free up a space, so to speak, in the limit of 40 processes mentioned above; thus allowing the creation of a new, active process in the killed one's place. Thus 40 processes can be stopped, hence no more forks ever. They can now be killed at your leisure.

Is that right?

What you probably saw was AmigaOS 1.3 on an A500, and the AmigaOS has seriously upgraded since that.

Fact is, that the current version of AmigaOs(v3.1) is much faster,better
and more reliable than the current version of MacOS(7.6).

And this is in spite the fact that it haven't been seriously developed
since Commodore went bankrupt in '94(nobody was talking about the AmigaOS
being fo sale in '89).

Can you for instance preempively multitask on your current Powermac?

Do you have a shell?

Fine..If the Falcon meets the needs for audio production, great.
However, performance on the other platforms are increasing
rapidly and
prices are dropping. Espicially the Powermac 6500 line..

> > And you have benchmarked this? Whats your deffinition of near 6400
> > performance? Do you know what a 6400 is?
>
Yep..The 6400 is part of the defunct Performa line and has been
renamed
the PowerMacintosh. Processor speed ranges from 180mhz all the
way up
to 300mhz(!) for the 6500 line.

> Don't be such an idiot. I work on Macs daily, including said 6400.

```
True..  People should buy what ever they think is best..  But
the
Falcon technology needs to be upgraded and the pricing should
reflect
the state of technology.  The Falcon has been stereotyped as
just a
midi box.  Imagine what would of happened if a million were
sold..
Falcon users would of have not complained about the sorry state
of
internet and web tools..

True.. The new Virtual PC by Connectix will alow PowerMacs from
the
lowly 601 series to run Wintel 3, 95, Dos, OS2 and NextStep at
higher performance than SoftWindows.

How do we know that it was intended to be spelled this way? Is there any evidence that UNIX was actually spelled this way?

>later, "Unix") was a pun on Multics which was one of Unix predecessors.

Multics can hardly be called a Unix predecessor, except in the vague chronological sense. It took about a decade for UNIX to acquire some of the sophisticated memory-mapping features of Multics. In Multics, every system object (such as a file) is a memory mapped region. Not bad for 1960's. Ken Thompson did work on the Multics project---that is the real connection between Multics and UNIX. Demand paged virtual memory first appeared in BSD 4.2 (?), and I believe it was SunOS that introduced shared libraries.

>Multics stood for "MULTiplexed Information and Computer System"
>(watch for those capitals). "UNIX" stands for "UNiplexed Information
>and Computer System". My references: FAQ for comp.unix.shell and a

Is that so? I don't see an X anywhere in the expanded phrase. UNIX is a pun on an acronym. A pun on an acronym need not itself be an acronym.

BTW the FAQ for comp.unix.shell is chock full of carelessly written shell programming examples, so why trust its assertions about computing history?

For example, in question 2.6 of the FAQ (How do I rename "*.foo" to "*.bar"...) we have:

      Korn Shell:

```
        for f in *.foo; do
            mv $f ${f%foo}bar
        done
```

This script will do funny things if the the '*.foo' pattern matches filenames containing spaces, meta-characters or names that look like command line options. Hence it fails to have general validity.
A better version is:

```
     for f in *.foo; do
         mv -- "$f" "${f%foo}%bar"
     done
```

The quotes prevent the splitting of the expanded text into multiple words, and prevent the text from undergoing pathname expansion. The -- ensures that none of the filenames are misinterpreted as an option to the mv command.

As long as 680x0 code has to be run in emulation mode on the
PPC, there is little benifit for MagiC Mac users to purchase
a 300MHz PM. As far as I can tell, a 50MHz 040 executes 68000
code just as fast as ANY PM. Actually, I shouldn't say as far
as I can tell, it is a fact. Windows and other X86 code isn't
an issue here. Why not just purchase an inexpensive Pentium
200 to run the apps?

Another short blurb, unrelated, but I just read a VERY short
review of Light Wave 3D for the Mac in this months Mac World
(or Mac User, their about the same). I found it funny that the
premeier 3D animation/rendering application for the NT/W95/Amiga/
SGI market was only given about 1/8 of a page for a review.
The way the article was written, it lead me to believe the guy
finds it to much trouble to tie his shoes in the morning unless
he can do it by clicking from the desktop.
What I don't find funny is these are the same people "telling"
the public which PM clone is the best and how great the "next"
version of the Mac O/S will be.

What applications would these be? Define wonderful? With the
introduction
of Newsie, I have elimated all but Netscape from my internet needs on a
platform
other than my TOS machines. I haven't had much time for surfing lately,
but you
should really see CAB in action at 1024*768 24bit color on my Falcon
with my
new Nova card.

Funny, I just picked up a Falcon for $150.00. Works fine for me
and my bank account. And with the 040 installed, it will run just
as fast as the 300MHz Macs do for my needs, under TOS.

Hello folks,

Could somebody help me getting joysticks for my ST computer?
I'm not talkng about the crappy ones, but the good old joysticks like
Kraft-joysticks.

E-mail me privately if you can.
Thanks.

Again, the issues are: Price, productivity, and numbers of outputs and
inputs vs. price.

> > On the other hand, just how much experience do you have with the
> > Falcon? Have you ever edited digital audio on one?
>
> No, I can't say so..

I don't understand how you can even comment about something you admittedly know nothing about. Why?

> The new 6500 just blows away the Falcon..

I'm sure it does. But how much does it cost? For $300 used, you can have a Falcon and be working immediately with audio (and SCSI hard drive). For $400, you can add 8 balanced analog outputs at pro line level. For another $400, add eight inputs (balanced line level).

A used Power PC, say 7200 or something, costs, what, $1000 used? To add eight additional outputs, there are a couple of options. There's a new board from Emagic that costs around $600 that will give you eight outputs, but it's on RCA jacks, unbalanced, not at professional line level. You could buy a Korg 1212 (when it's released) for around $1000 and then buy their 8 output box for $500 that will get you eight balanced line level outputs, but that's still a lot more expensive. A used Pro Tools Project board and software setup will set you back about $1500 or so, but at least that also gives you eight inputs as well. An Audiomedia III card will give you 4 outputs, for around $500 (RCA unbalanced not pro level).

As I've said before, I'm sure at some point the PPC will be a less expensive solution for HD recording with multiple pro outputs. It isn't now, that's all there is to it!

> I am sure you are getting ripped at these prices.. And I know
> there are cheaper solutions..

You don't "KNOW." Otherwise you would have posted something concrete and proven me wrong. I invite you to ask everyone you know if there is a cheaper solution.. hell, call recording studios, music stores, etc, and ask them.

> owners are pissed because they can't find decent internet
> tools..

That may be. I don't use the Falcon to access the internet, I have a cheap 486 for that. The Falcon is just as suitable for creating raw material for the internet as any other platform. Now, the Shockwave encoder and other internet tools are not available on the Falcon, but that has nothing to do with music and audio PRODUCTION.

> True.. People should buy what ever they think is best.. But
> the Falcon technology needs to be upgraded and the pricing should
> reflect the state of technology.

It does. That's why you can buy a Falcon for $300 used. That's what the market has to say.

> The Falcon has been stereotyped as
> just a midi box. Imagine what would of happened if a million were
> sold.. Falcon users would of have not complained about the sorry state
> of internet and web tools..

Again, that's not what we're talking about. I am talking about, once again, the Falcon's viability as a cost effective hard disk recorder/MIDI/audio production solution. You have said absolutely nothing to refute my points. You actually don't know enough about the audio/music production market to do so anyway, so the point is moot.

> I know that Falcon users are dumping their midi systems for all
> Mac base one..

No, you read that ONE Falcon user is dumping his for a Mac. Actually, I know a few others who have done the same thing. If you subscribe to the Cubase Users Mailing List, you'll meet others who have dumped their Falcon or ST for a Mac or PC. All have had problems of one type or another that have impacted their productivity. Yes, they eventually get them running, but most Mac users have complained about the delay from audio input to audio output when using the stock audio inputs and outputs, and the quality of the audio ins and outs. The delay doesn't exist on the Falcon, because it's designed for audio. Apple has come out and admitted that the audio market wasn't a significant enough market for them to work with.. and it shows in their product. Their stock inputs and outputs are worse then PC sound cards costing $100 and up.

Creative people don't need to have the latest and greatest to create great work. That's why many painters still use a paintbrush, many writers still use a manual typewriter, and many songwriters just use an acoustic guitar.. and that's why I use a Falcon.

Today, there is no more cost effective, reliable, and better integrated audio/MIDI solution then Cubase Audio on the Falcon. Yes, there are BETTER solutions, but they cost much more.

-Mark

>
\>Why do you think they called the ST "JackIntosch" :)

Certainly not because of its "instability"... Jack Tramiel brought the ST out and it was (somewhat) similiar to the Macs OS so it was dubbed the "Jackintosh"... At its introduction, the ST was the best/affordable comp. available...

==========

Web TV gives him a huge pipeline from MSN to users.

Gates will likely "hardwire" the web TV backchannel to MSN, with the
the satellite as the forward channel.

This gives him a large pipe directly to users.

It's a very smart move.

Almost true, Apple sued Digital Research (Which created GEM) and DR
had to modify GEM a bit: They had to remove the trashcan and do
something with the window-gadgets. Atari got away with the "original"
GEM though, which is why Atari-GEM is superior to PC-GEM.

===========

This may be true now, but I'll bet that Gates reengineers the satellite feed and adds an "output to computer" port on the set-top box. Instead of being constrained to the web TV's box, the subscriber will be able to use their home PC.

This will give Gates a large forward channel, with all subscribers back-channeling through MSN.

At $50/month, and 1 million subscribers, Gates gets back $600 million/year. Would 1 million people sign up? Probably..

So what your saying is that JTS, a little hole in the wall Hard Drive wannabe manfuacturer with stock hovering in the 1 1/16 area is trying to buy a piece of Apple?

Come'on!!!

Curt

  Hey S.Lai! Anyway we can setup a resident null string generator that will
  enter an negative hexadecimal value for each letter in the messages that
  this Sincrap (non)entity enters thus cancelling it out? <grin>

The hardware is more than good enough, the software support is the problem.

I don't think it was any more stable than 7.6, I've not had 7.6 for long but even with all the extensions I've got loaded I've not had it crash yet, YMMV. If you are taling about efficiency when you mean faster then I'd have to agree. What is "Better"?

> Can you for instance preempively multitask on your current Powermac?

Yep but not under MacOS :(

Firstly, I don't believe Im even daring to comment on this post, but its
just so intruiging (though certainly not spelt like that), I'd thought
they were extinct by now.......

> > >> Speaking of Apple. IMHO the biggest mistake that Apple made was when

I think the word is.......something like "dedicated" but a tad more
unstable.

>>>>> I saw and used the Amiga OS; for the time it

Good point...but I dont know if the Atari ST was the counter-argument I would have chosen......

>>>> The Atari ST was not so

> > seriously upgraded since that.

The Amiga's hey-day if I remember correctly. AmigaDos 1.3 had a great shell, Arexx (remember the press ravings when OS/2 finally got rexx years later ?) and a groovy rebootable ramdrive. As it stands, except for the GUI and certain additions to try and keep it relevant with current day "buzz words", there has been little architectural change.

> >
> > Fact is, that the current version of AmigaOs(v3.1) is much faster,better
> > and more reliable than the current version of MacOS(7.6).

Come on, you can't be serious. I was nice, but was showing the effects of less-than brilliant planning during development. Also, considering the main-stream machine, the godsend after 10000years of 8Mhz 68000, was only a 16Mhz 68020 (the A4000 was too expensive, not to mention only ever in stock sporadicaly), I dont think "faster, better (some things were certainly "groovier") but fairly reliable (it would be unrealistic to say "quality" was a hallmark of C=). Anyway, its all irrelevant the MacOs version numbers are larger, so it must be better.

And lastly, I feel so guilty for briging up this last point.... but... dont you remember the serial ports! You have to admit they were a joke. A don't try and mention the multi-port serial boards... I and a friend ran an Amiga BBS and we never got the damned thing to work properly.

>
> I don't think it was any more stable than 7.6, I've not had 7.6 for long

Testify! Testify!

Doesn't the doctrine ever change ? I was saying this as an Amiga en-feavored teenage saleman in a computer shop. I seem the remember the current day competition was the Apple IIGS (Nostalgic but not exciting), Atari St (Im sure there GUI was invented by the people who created Teletext) or Messy Dos (nothing need be said). Lets keep things in perspective though.

So my final question
is...
....
..........with some believers still turning up to Amiga Church on
Sunday... Do you think were witnessing the birth of a new religion which
will rival Christianity in 1000 years ? ..... Hmmmm...

Regards and evasive techniques in advance,

Daniel Soderstrom.

: Testify! Testify!

: Doesn't the doctrine ever change ? I was saying this as an Amiga
: en-feavored teenage saleman in a computer shop. I seem the remember the
: current day competition was the Apple IIGS (Nostalgic but not exciting),
: Atari St (Im sure there GUI was invented by the people who created
: Teletext) or Messy Dos (nothing need be said). Lets keep things in
: perspective though.

: So my final question
: is...
: ....
..
: ....with some believers still turning up to Amiga Church on
: Sunday... Do you think were witnessing the birth of a new religion which
: will rival Christianity in 1000 years ? ..... Hmmmm...

: Regards and evasive techniques in advance,

: Daniel Soderstrom.

I remember back in 86, 87 and 88 running a 500 under 1.3 in a stable manner. But
everytime I'd go to a store to check out the machines, salesmen were crashing them
left and right. They knew nothing about multitasking, priorities etc.

It sometimes seemed to me that they *wanted* the machine to crash. That's not
true
of course, but it happened every time.

I believe the reason was mainly bravado. Most of the salesfolks were quite
ignorant
of either the Amiga, multitasking, or computers in general, yet they valliantly
clicked
away like pros, in turbo mode - in order to dispell any inkling that they were in

actual fact, lamers. Blame it on the machine, blame it on the software - these digital supermen would blast their way blissfully into guruland without fail.

Meanwhile, many of us ran 1.3 with few glitches once we'd balanced our systems to our specs. Testing new public domain software would, yes, crash the machine more often than we'd like, and that *could* be squarely blamed on either the software itself, or clashes with installed software which was not quite up to snuff.

But there was *no* excuse for allowing a suite of installed programs, on show at a store, to crash as a matter of course. It demonstrated a lack of ability, knowledge, and interest in the machine and its OS.

There must have been exceptions, but I never saw them, except for once or twice at a large computer show, where often they *did* know what they were doing. �It seems many stores got salesmen where they could get them, while show booths had literates onboard.

As for the 'look' of 1.3 one could make it quite acceptable to practically any taste. There were slews of esthetic addons and beautifiers around, most of them in the public domain. No two worksessions looked alike in *my* neighborhood. I think the argument that the Amiga OS looked 'ugly' is not valid.

The main drawback was interlace flicker. This, with a simple add-on could be overcome. Considering the multitude of add-ons the msdog machine of the mid-80's needed, I don't think it was unreasonable to guage a machine *with* basic add-ons onboard, like the flicker-fixer for the Amiga. Nex

So did I when I read about on comp.risks, especially as the posting date was close to April 1, maybe it is a joke. If not it bl...y well ought to be.

OK maybe they haven't gone through with the deal yet, but the intention is there I am sure. If you can't beat it, buy it and bury it would apply nicely to BGs philosophy of world domination, where Unix and Java are concerned.

Below I include a quote from the source which was:

RISKS-LIST: Risks-Forum Digest Tuesday 1 April 1997 Volume 19 : Issue 01

beginning of posting is:

Date: Mon, 31 Mar 1997 17:04:01 -0800
From: mas@acm.org (Mark Stalzer)
Subject: Microsoft buys Sun

This item may be of some interest to RISKS readers, given all of the discussions about ActiveX and Java. -- Mark

----

Redmond WA, March 31 (Routers) - Microsoft Corporation announced after the close today that it will buy Sun Microsystems in a deal valued at $11.7 billion. The price works out to $50 a share, which is a premium over Sun's close at $34. Microsoft will finance the deal by issuing 50 million shares of common stock, using some of its cash reserves, and borrowing $5 billion at "very low rates" from a "long time strategic partner" rumored to be Intel Corporation. Every 4 shares of Sun stock will be exchanged for 1 share of newly issued Microsoft stock plus approximately $100 in cash.

Bill Gates, Microsoft's Chairman said "It's time to kill Unix. Unix is providing stiff competition to Windows NT in the server arena. We have already placed NT on Digital and HP servers, and Sun was the only

substantial holdout. So we decided just to purchase Sun to assure that their servers ship with NT." He continued, "We also wanted control over Java to better position ourselves to, uh, compete with Netscape."Redmond WA, March 31 (Routers) - Microsoft Corporation announced after the

He continued, "We also wanted control over Java to better position ourselves to, uh, compete with Netscape."

<snip>

A spokesperson for the Department of Justice said there was no official comment on the proposed transaction. Although, a highly placed Justice source felt that there shouldn't be any problems because "Microsoft is a software company and Sun is a hardware company."

<snip>

I consider that many would take issue with the statement that implies Sun is a hardware only company. Solaris and Java are strange kinds of harware. The DoJ obviously don't know much about the industry eh!

subscribe to comp.risks for full text and other interesting postings, many to do with the Y2K problem at the moment. Full information for getting hold of past digests is at the bottom of each edition.

Lionel

: vs.
: centre -> centred

The best explanation seems to be that you can't spell :)

: Which makes more sense now?

Neither one of those -- the one that makes the most sense is American
English (center -> centered) :)

What were you attempting to compare, anyway?

Tom Kennedy

Microsoft does not own Sun. That would be completely insane.

I'm sorry, but that is a fault in the OS. It should not let anything crash
the system *ever*. OK, so this is too good to be true, but generally with Unix
systms you have to try very hard to crash the entire thing.

From what you say, Amigas sound just like Lose95, where you have to
unconciously keep track of what tasks you are running and whether they will
crash the system.

User-friendlyness in my book is not a gooey interface, but *stability*. You
can learn any interface, but you are stuck with a crasher however good you
are.

Newsgroups: comp.sys.atari.advocacy

"Knights of the System Table" is completely independent unbiased on-line computer magazine for computer users by computer users. Its goal is to try to give each computing system equal share of coverage. Computer systems range from programmable calculators, through palmtops, word processors, organizers, to laptops, notebooks, personal computers, workstations, and servers. We will also try to provide programming lessons.

The premier issue will be @ http://www.clarkson.edu/~dulino/knights/ on April 14th.

Although we are starting from a small bi-weekly publication, if we get enough hits we'll move to the commercial server and try charging for advertisements. However, right now we need about three volunteers per each computing platform who would provide us with articles, news, columns, tips-&-tricks pages, etc. twice a month. Eventually, if this venture turns out to be a viable one and we move to the commercial server, we'll be able to reward those who submit articles. But for now, it is completely voluntary.

If you would like to become a reviewer or columnist, reply to me by email. Please state what would you like to be writing about so that I can set up a section for you. Again, we need only three reviewers per each system.

Thanks in advance,
Oleg Dulin

I agree, I never had any problems running 1.3. I liked it, with the 500k memory expansion
I had, I could set up a RAD disk with the OS, Scribble with its spell checker. This provided
me with a rock-solid and fast wordprocessing machine.

> Meanwhile, many of us ran 1.3 with few glitches once we'd balanced our systems

Yeh, some games used to crash, but not very rarely.. the ASDG serial
board I had screwed the machine up though.

> As for the 'look' of 1.3 one could make it quite acceptable to practically any
taste.

argument
> that the Amiga OS looked 'ugly' is not valid.

I never said it was 'ugly', just explaining that the previous writers
claim that AmigaOS
3 was not radically different from 1.3 with the exception of
improvements in the GUI. I
personally really like 1.3, at the time of its release it had the most
advanced feature
set of any mainstream OS whilst being mature,reliable and efficient. The
only thing better
on the Macintosh at the time was the GUI, but Macs were almost 8x the
price of the Amiga. I
used to hate Mac's.

>
> The main drawback was interlace flicker. This, with a simple add-on could be

> think it was unreasonable to guage a machine *with* basic add-ons onboard, like
the
> flicker-fixer for the Amiga. Nex

The flicker never bothered me cause I never used that mode... However, I
dont think the
flicker fixers can be guaged as a "basic" add-on... They were damned
expensive and required
a multi-sync monitor. I could never afford one and neither could most
people. What was always
the brilliant thing about the Amiga, was that it offered so much and
asked for so little ($$$).
Oh yeh...it also offered free phone calls! :)

Cheers

Daniel Soderstrom.

Well, a machine and OS *should* be able to stand up to such abuse. You
shouldn't have to pamper a computer to keep it running.

>Meanwhile, many of us ran 1.3 with few glitches once we'd balanced our systems
>to our specs. Testing new public domain software would, yes, crash the machine

No, it demonstrates that WB 1.3 was not a stable platform for randomly
running the apps available to it. What you are suggesting is that store
employees should spend time getting personal with the system the way you
do at home, weeding out offensive apps and avoiding crashes. This isn't
always practical.

==============

Interesting, but I now realize you're totally hopeless.

What I've spun out is entirely reasonable and very likely to occur. Most of the technical folks around here agree that Gates will do exactly what I've mentioned, as this is the easiest way to rapidly gain a large Web TV userbase. Adding the ability to feed a PC, as well as a TV, is likely very easy (this technology already exists and is in use BTW).

Why you decided that a comment on Web TV was somehow related to OS/2 is way beyond me (and probably most of the planet).

It appears you've decided to extend your "reason for being here" that you gave us well over a year ago. At the time, you decried the "bashing" that OS/2 users were doing to users of other operating systems. Over the last year, I've pointed out numerous time that you have been doing a lot of "gratuitous bashing."

It appears you've degenerated so far as to assume that anything said by anyone who uses OS/2 is a good reason to bash that person "simply because they use OS/2."

The technical term for what you're doing is "bigotry." A bigot assumes that just because a person belongs to one sub-group, they can be discriminated against in all fields of endeavour. Most folks don't like bigots, I sure don't -- go away bigot.

If it isn't! Than we're in for big trouble since the first thing BG will probaly do is kill-off JAVA (the AMSTRAD-strategy) and replace it with ActiveX. Or maybe they start charging through ppl the nose for JAVA-licences whereby these are even more out-of-reach for smaller companies like Acorn etc... So much for ART's NC and all major JAVA implementations :-(

I have the nasty feeling that there's going to be a real war by the end o/t century. Poor against rich. Small agianst big. North against South. Moslim against Christian. (Big) MicroSoft against the (small rest o/t) world. :-(

I pray it's a joke!

Cheers

All software that was written following Commodore's guidelines (basically, just be OS-friendly) *does* work on Cybergraphics. Yes, even software from 1985 will work. Geez, how many times does this have to be repeated? If you're not going to pay attention to the answer, then stop asking the question!

AHI is a different matter -- it's a new API and does not change audio.device, so software has to specifically support it. However, you could write a new audio.device that linked into AHI to give the same compatibility as cybergraphics, but AFAIK this has not been done yet.

I heard that Hitler was a closet Anglophile but that he preferred the American version of the language. The only time he could speak the British version of it was when he had a really bad head cold...:) Really, give it a rest or drop c.s.m.a from the distribution line, will you.

As far as capibilities go, the Falcon is still on par with current PC technology. But the new Phenix is a completely updated Falcon with a brand new OS.

> Imagine what would of happened if a million were sold.. Falcon users would
> of have not complained about the sorry state of internet and web tools..

And what the crap did does that have to do with hardware? Internet software is just that, software.

> I know that Falcon users are dumping their midi systems for all
> Mac

HAHAHAHA!!!! ROFLOL!!!!

Come on...a Mac that's more expensive and requires a seperate MIDI device just to plug the keyboards in...

Falcon's are niche computers...and you better get used to the idea because when Apple closes down, and it will, Mac's will only be sold as niche platforms and nothing else.

Tell me...have you even 'used' a TOS computer at all???

    Practical or not, it is still a necessity. Microcomputer OSes in
    general are no less unstable. They still require some degree of
    pampering and even the 'robust' systems require some non-trivial
    sysadmin.

Practical or not, it is still a necessity. Microcomputer OSes in general are no less unstable. They still require some degree of pampering and even the 'robust' systems require some non-trivial sysadmin.

I think you meant to write "It was nice": Present tense please,
it *is* nice.

> but was showing the effects
>of less-than brilliant planning during development.

Cough, this can be easily considered one the most severe showings of
ignorance on Usenet ever. Ask software experts from all places, and
they will assure you that the concepts under the hood of AmigaOS are
so elegant and nearly perfect, that they are the main reason we still
have these many Amiga newsgroups today, alive.

>And lastly, I feel so guilty for briging up this last point.... but...
>dont you remember the serial ports! You have to admit they were a joke.

Why? I have no problem running my 28.8 k modem with it. What's your
problem?

>A don't try and mention the multi-port serial boards... I and a friend
>ran an Amiga BBS and we never got the damned thing to work properly.

You must have done something severely wrong, perhaps no real experts
at work? May I inform you that until very recently, the majority of
German BBSes ran on Amigas! And this because of their superior handling
of a *lot* of active serial ports simultaneously, with conventional
modems as well as with multiple ISDN lines via ISDN plug-in cards.
This is the reality!

>Doesn't the doctrine ever change ? I was saying this as an Amiga
>en-feavored teenage saleman in a computer shop. I seem the remember the
>current day competition was the Apple IIGS

Must be a long time ago. Fact is, you can *still* buy current Amigas,
and they do well against the competition and this still in the eyes
of being underpowered processor-wise. If that doesn't show the superiority
of the concept and architecture, I don't know.

>Sunday... Do you think were witnessing the birth of a new religion which

: : Care to point out a single instance where Apple used 16 bit code?

: Apparently you missed an earlier post:

:   16-bit Intel CPUs do have a 32-bit pointer, a far pointer (16-bit
:   segment + 16-bit offset). They are much less efficient than today's

: 32-bit offsets but they do work.

You are incorrect. Apparently you've never programmed a 16-bit intel CPU in assembly. Allow me to correct your mistakes:

> 16-bit Intel CPUs do have a 20-bit pointer, a far pointer (overlapping 16-bit segment + 16-bit offset). They are much less efficient than today's 32-bit offsets, and being only 20 bits, only let you address 1 MB of memory space. This is where the 1 MB addressing limit of the 8088 came from. In a pathetic attempt to improve things on the 286, intel used a 64K "window" located in the lower 1 MB address space to access memory above 1 MB.

To sum up, on the 8088 you have only 1 MB of memory/MMIO. On the 286 you have either that, or (1 MB - 64 KB) of direct memory/MMIO along with a 64 KB sliding window into the memory above 1 MB.

A far cry from the 68K architecture indeed.

[Gag, snort, laugh, laugh ... Thank God I wasn't drinking hot coffee when I read that]

: ... Allow me to correct your mistakes:

When "correcting" other's mistakes it would be helpful if you understood the topic. I could provide a reading list to bring you up to speed, feel free to email me. ;-)

:   16-bit Intel CPUs do have a 20-bit pointer, a far pointer
:   (overlapping 16-bit segment + 16-bit offset) ...

In a 16-bit code segment a far pointer is a 32-bit data structure. With respect to what is referred to today as real mode you are partly correct that the 16-bit segment and 16-bit offset are combined to form a 20-bit address. But this is a linear address, not a far pointer as you claimed. Secondly, in 16-bit protected mode the segment is not combined with the offset as you described. The segment indexes into a descriptor table that includes among other things the base address of the segment. The offset is then added to the base address to form a linear address, not a far pointer.

: ... They are much less
:   efficient than today's 32-bit offsets, and being only 20 bits,
:   only let you address 1 MB of memory space. This is where the 1 MB
:   addressing limit of the 8088 came from. In a pathetic attempt to
:   improve things on the 286, intel used a 64K "window" located in the
:   lower 1 MB address space to access memory above 1 MB.

Severly misinformed again, with the 286 Intel introduced 16-bit protected mode. I refer you to my preceeding paragraph and how the segment and descriptor table are used to form a linear address. The base address of a segment as defined in the desriptor table entry may be located anywhere in the 286's linear address space (which I think was 24-bit).

: To sum up, on the 8088 you have only 1 MB of memory/MMIO. On the 286
: you have either that, or (1 MB - 64 KB) of direct memory/MMIO along
: with a 64 KB sliding window into the memory above 1 MB.

By "sliding window" were you attempting to describe EMS, a bank switching scheme Lotus/Intel/Microsoft came up with to let real mode DOS programs access memory beyond 1M? This was not part of the CPU, it was implemented by the system. The 286 CPU had 16-bit protected mode, numerous DOS extenders and OS/2 made use of it.

: A far cry from the 68K architecture indeed.

Well you did manage to get one thing right, the Intel 80x86 architecture is a far cry from the Motorolla 680x0 architecture. :-) I never truly enjoyed x86 assembly until I started doing 32-bit work on the 386, but still 68K assebly was a much more pleasant experience. I'm still undecided about PowerPC assembly.

No, no, you misread it. He didn't buy Sun, he bought *the sun*. You know, that big ball of fire up in the sky. He plans to control it with an array of NT machines. Yes, the age of darkness is truly upon us.

Wake up, Zig Zag, you're not talking to non-sentient zombies who believe anything you put in print on usenet. Look at my carets above; what do they emphasize?

>> To all: I nominate myself for the "Arami of the Week" award.

Forging quotations? That's always a good sign, no? Your ISP might find this amusing. Do you have any idea how low you stoop when you alter a quotation of someone else's text? That is libelous. I am not at all surprised at your behaviour, though, I saw it coming. Arami did the same thing, as did a few other foaming-at-the-mouth fanatics before him.

Only in your dreams! The Falcon is stuck on 030 technology and the
graphics/video subsystem is outdated! This Phoenex is most likely
overpriced as the Hades is. PowerComputing's PowerCenter
150(ppc604/150mhz) for $1499! Price includes CDrom, ethernet

> HAHAHAHA!!!! ROFLOL!!!!

Care to provide that Macs are more expensive? Please list the
equevelant Mac hardware to the Falcon...

Postscript support has been there since at least OS 3.0. The networking support *really* needs to be improved, they should enhance Envoy and bundle it with Amigas. Java support is quite unimportant in my eyes. Protected memory would be quite nice, though. The datatypes can be improved, they should support incremental rendering. The datatypes have been taken up by the BeOS now, though. Developing new graphics and sounds chips can be hard and expensive, I think.

>Hope Gateway realizes the potential of what they have in their hands.

I wonder, myself. What were they thinking when theey spent money on the Amiga, it doesn't generate much revenue, AFAIK, and they don't seem to have any emotional bounds to the Amiga either...

ARexx didn't come with the Amiga until OS 2.0, though you could buy it separately before that. There hasn't been a need for much architectural change either, since it had from the beginning what most other systems had to add on later.

The A1200 is quite weak nowadays, but it was a real upgrade from the A500. Tack in an accelerator (And of course the HD) and you're off.
I'm not buying your argument over MacOS system versions, that'd mean that the Mac must have been one of the most unusable systems ever if it took 7,5 versions for it to reach today's level.

>And lastly, I feel so guilty for briging up this last point.... but...

I admit they could be in need for buffering, but I've never had any problems using my Amiga's serial port with today's modem speeds. I call Amiga BBSes regularly, and have dabbled at running one myself, and the serial ports have never caused much trouble AFAIK.

The ST GIU was created by Digital Research. It's no worse than Windows. Anyway, it's strange that the Mac still can't cope with what you spoke about as a teenage salesman.

Nah, not really. I just wish that there'd be some more diversity in the computer field, it's a pity that the two giants of Atari and Commodore have been reduced to the feeble state they're in now.

I think there are already too many diffrent antiMS logos right
now and the number is still growing. We should exhibit all those
logos on one site to let folks vote. The winner logo should
then be accepted and used by all antiMS campaigns.
Suggestions on that?

Really ? I thought that OS/2 is an IBM product.
You can blame a *LOT* of rubbish on Microsoft, but not all.

Stephan

Not any longer it's not, and the Rexx subsystem was always IBM's product.

The point is that 95% of the desktops don't need an OS that canhandle
terabyte databases and industriial process in real time.

That other 5% is handled nicely by OS's like NT, QNX, RNX, Unix, even DOS
can handle real time, in fact many industrial CNC applications are DOS

based.

Nobody is saying that 95 is the perfect OS for everyone, if it were, there wouldn't be NT.

| That's interesting.  In OS/2 2.0 (or was it 1.3? i don't remember) If a
| Rexx program abended, all open files remained open.  You had to reboot to
| release them.

It's interesting, but nonetheless appropriate, to be comparing problems in
an OS version released several years ago (OS/2 2.0) to Win95, considering
that's how behind technologically Win95 is.

Where have you been?
OS/2 is a product invented by MS. IBM's mistake was thinking they
could do anything with it.

>> These are not systems with which you could run terabyte databases,
>control
>> industrial processes in real time, manage telephone networks, etc. They
>> are toys for home entertainment and lightweight business management.
>
>Which is 95% of the uses of computers...

And yes, 95% of businesses are using MS products. Thats because 95%
of businesses think they can maintain them with $24K/yr kids,
and are willing to tolerate up times of less the 95%.

William Taylor Wilson <fluffy+@andrew.cmu.edu> wrote:

> there isn't even any such thing as "America-speak" except in slang.

Oh, but there is, much of which is using the same word for two
different meanings. I have the start of a comprehensive list of
these, but a few examples should give the flavour.

In America-speak, there is no distinction between:

to Alternate between two things/states, and various Alternatives.

to Check something and to pay by Cheque

and to /pay/ a Bill (perhaps by cheque!)

Routing an enemy and Routeing a cable, say

to Tire through effort, and a Tyre on a wheel

to go Through somewhere and To a destination

There are also the distinctions between nouns and verbs, for example to license and a licence

And the distinction between an Ass (a beast of burden) and a Butt (something done by a goat, with its head).

As can be seen, manuals could need extensive re-writes for the American market, at least for British products. Perhaps this is one reason British technology has difficulty penetrating that market.

Wild & Wacky Atari Auction (Update #11)

Rules and stuff:
----
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:

$1 - $5 ==> .50
$5 - $20 ==> $1
$20 + ==> $2

7. Trades - Always accepted so long as its Atari or made for Atari
If you think you may want to trade, e-mail me your trade list ASAP
and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be
taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will
be accepted. I would NOT reccomend sending cash, but some people seem to
anyway. Checks will be held for approximately 1 week to clear. MO
orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 15th.
One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

You shouldn't post inflamatory things like this, unless you want flames. I have found Windows 95 to be a very stable product. I have been running it for almost 2 years and have not had any significant problems with it. I recently purchased a 133 mhz Pentium motherboard and a new case, moved all my drives and cards from the old system, added a new hard drive and 16 megabytes of RAM. The system booted right up, no problems.

Unfortunatly, OS/2 belongs to a company I will not buy from. I will not support IBM in any way shape or form. I am not fond of their marketing practices (they are actually guilty of, just about, everything Microsoft has ever been accused of).

Huh? What planet did that happen on? OS/2 was a joint IBM / MS
product. I can't remember who wrote what, but I think MS wrote
PM. AFAIK IBM did most of the work on kernel and OS stuff.

[...]
> And yes, 95% of businesses are using MS products. Thats

Probably true, but the same 95% is probably using IBM
products as well. For one thing, they are probably using
IBM technology in MS products, like OLE.

Another thing to remember is where company critical data
is stored. I have heard numbers like 70% on IBM systems
like AS/400, MVS and the likes.

There does not seem to be the imperative the other way round. Does
that mean that the average citizen of the USA is less capable than
the average citizen of the UK in reading an alternative version of
English? Do you really mean that the US citizen is thick?

Before anyone flames me can I point out that my considered opinion is
that (s)he is simply an intelligent person suffering from being fed
too much pap.

Try this:

```
{
  while (1);
}
```

In the message handler...

I did it (well, not exactly :-)) once accidentially and only Reset
could help.
Actually I don't understand how people can even seriously talk about an
OS that can be crashed by an application with one line of code...

Exactly. So unless you have a plug and play device, it's safer to just tell the
OS where the port and IRQ is. At initialization time, the kernel can check
for the commonly expected places (e.g. the typically assigned addresses and
IRQ's for the standard two serial ports). On my motherboard, I can set
the address of a serial port to just about anything. The OS would have to
probe the entire 64K port space to try to locate the serial port, in
the absence of PNP.

Only a complete idiot would say that an OS which is taking advantage of PNP
at initialization is more advanced compared to one which has to search
through non-PNP devices. And in any case, PNP is something that just affects
PC's because their architecture was designed by brain-dead IBM folk.
Real UNIX workstations have had the equivalent of plug and play for ages.

The HP9000/725 sitting on my desk labels devices by means of ``hardware
paths''. The ``ioscan'' command will detect and produce an
exhaustive list of all hardware connected to the system:

```
DESCRIPTION
    ioscan scans system hardware, usable I/O system devices, or kernel I/O
    system data structures as appropriate, and lists the results.  For
    each hardware module on the system, ioscan displays by default the
    hardware path to the hardware module, the class of the hardware
    module, and a brief description.

    By default, ioscan scans the system and lists all reportable hardware
    found.  The types of hardware reported include processors, memory,
    interface cards and I/O devices.
```

```

I find that talking with Windows users about better operating systems is like
trying to describe the quality of a Bach orchestral suite to one who is
congenitally deaf.

| You shouldn't post inflamatory things like this, unless you want
| flames. I have found Windows 95 to be a very stable product. I have
| been running it for almost 2 years and have not had any significant
| problems with it. I recently purchased a 133 mhz Pentium motherboard
| and a new case, moved all my drives and cards from the old system, added
| a new hard drive and 16 megabytes of RAM. The system booted right up,
| no problems.

Interesting that you have been running it for almost two years since it's
only been released for about a year and a half.

I wasn't speaking of anyone's personal experiences with it or its
stability. I was speaking of its technical design, which is still
dependent on DOS.

|
| Unfortunatly, OS/2 belongs to a company I will not buy from. I will not
| support IBM in any way shape or form. I am not fond of their marketing
| practices (they are actually guilty of, just about, everything Microsoft
| has ever been accused of).
|

Hmmm. Microsoft's marketing practices are worse than IBM's (by your own
admission..."they (IBM) are guilty of, just about, everything Microsoft has
ever been accused of..."), yet you still buy from Microsoft. Why is that?
Sounds hypocritical to me.

Actually I know dozens of people how have been using it for about two years.
They were on the Beta release...

So be careful how you try to flame. Take it from someone whose had to de-footify my mouth a few times myself.

Been there, done that!!

I worked with DOS for years. Though it was just fine.
Then I installed Linux and Xwindows.
WOW! I don't have to three-key my machine anymore! No matter how
stupid my programming mistake was!

I still use DOS, but now I realize there are OS's that are actually
fault tolerant.

People won't realize this until they experience it first hand.

-Scotty

Far be it from me to pick up on grammer but I think you mean defamatory
ie "To speak ill of" etc. The whole idea of advocacy groups is flames,
it's the MCIBTY argument, the whole point is I say computer X is shit
and you say computur Y is shit,t hat's the idea. And it's quite clear
that Win95 is technologically behin, I take it you've nver heared that
saying "Win '95...Mac '89", not that System 7 is particularly superb,
however I do much prefer it to Windows.

I can say the same about my Mac, everything is pure plug and play the
videocard just dropped in and was ready before the configuration disk
had touched the drive and the same with the Zip, Hard Drives etc. It's
fairly stable too, unless you include Netscape but I believe the same
could be said for that on any platform.

24 Hours Remaining before the Auction goes into the Going Once, Going
Twice, SOLD.

This is your last chance to get ahold of some truly unique
collectables!!!!!

Wild & Wacky Atari Auction (Final 24 Hours)

Rules and stuff:
----
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid

3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
    $1 - $5 ==> .50
    $5 - $20 ==> $1
    $20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
    If you think you may want to trade, e-mail me your trade list ASAP and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will be accepted. I would NOT reccomend sending cash, but some people seem to anyway. Checks will be held for approximately 1 week to clear. MO orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 15th.
    One final post will be made to newgroups. A bidder who is not on the update list may bid on a G1 item, but not a G2 item. Any raise to an item in the G1 or G2 phase will result in the item staying or returning to G1.

24 Hours Remaining before the Auction goes into the Going Once, Going Twice, SOLD.

This is your last chance to get ahold of some truly unique collectables!!!!!

Wild & Wacky Atari Auction (Final 24 Hours)

Rules and stuff:
----

1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
    $1 - $5 ==> .50
    $5 - $20 ==> $1
    $20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
    If you think you may want to trade, e-mail me your trade list ASAP and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will be accepted. I would NOT reccomend sending cash, but some people seem to anyway. Checks will be held for approximately 1 week to clear. MO orders will be sent out right away.

Do you offer to re-write the software they use for the better OS? That
might help.

I was surfing onto www.atari.com (jag' official web site) and I stopped on this line: "Last updated on February 20th, 1997". I thought that Atari has dissapeared with the JTS merging, but it seems not (because of this updating date). So, let me ask a few questions:

I was told that there are 3 guys left at the Corp: is this true ?
Can anybody tell me what Atari does exactly at this moment ?
What Atari becomes with JTS ?
And finally: is Atari still alive or not ?

(I don't want to get in trouble with anybody here, but just want to know what is really going with the Corp: we're not very well informed in France you know !)

Thanx you !

COMPUTER DIRECT WILL BE IN TORONTO ON WEDNESDAY MARCH 19th,

AT THE REGULAR MEETING OF THE TORONTO ATARI FEDERATION!

Doors open at 6:30 PM - Admission is free to TAF members

Non-member admission is $2 at the door

======= Lots of software for sale =======
======= Lots of hardware for sale =======

Chris Krowchuk will be demonstrating the ultra-powerful
DirecT60 Hades computer!

The meeting site is located at Memorial Hall in the North York City Center, 5110 Yonge St. at Parkhome Ave. Go to the lower level (Concourse). Go to the far end of the complex, to the Library Building. Memorial Hall is located beneath the Library. There are signs pointing the way.

Visitors from out of town can take Highway 401 to the Yonge St. exit. Travel north on Yonge St. for 5 stoplights and you're there!

Wednesday March 19th will be a great opportunity to upgrade some of your favorite software: NVDI, MagiC, HDDriver, and dozens of other titles. Tell Chris you're coming to the meeting and he'll bring what you need . . .

So what you are saying is that you have UNIX ``access''. What exactly is that? Remote dial-up? At home you have Win95 on your desktop. That can only be fairly compared with having UNIX on your desktop.

What sort of interface are you using? Motif? CDE? Or VT100 dial-up? What applications are you running under Unix?

>major "dumb nut" when it comes to Unix.. i find it very complex,
>difficult to understand, and hated the interface.. I always wished
>that it would have a better interface, a little more friendly and
>would support multy programming in every terminal.. Not that Unix is
>not a multi programming OS, but.. like if only u can open up more than
>one file with VI and minimise the other one.

Umm, modern vi programs let you do that. I use a vi compatible program called vim. It has a Motif or Athena graphical interface, multiple edit buffers and full vi compatibility in all but one command. It does work with text terminals too, of course. (Vim also supports Amiga, OS/2, 95 and NT and MS-DOS, it's not just a UNIX thing).

>But, i throughly find Unix as a very very powerfull OS, i can do soo
>much things in it where in Windows could only wish for. If only i can
>understand more about the scrips, i could do loads of stuff..

Have you ever run conventional applications under Unix, such as word-processors, or image manipulation programs? If all you use is a university account, your view is probably a little slanted. Your access to the system will be restricted, and the only software you are likely to be able to install on the workstation is freeware. You probably don't even have sufficient access to the University's facilities to be able to pop in and mount a CD-ROM.

This is one of the reasons why the biggest criticism of UNIX on usenet seems to come from undergraduate freshmen, CS dropouts or people who do Wintel tech support for a living: all they know of UNIX comes from their experiences with a dial-up tty interface.

>While Windows is concern, i liked it when i can do other stuffs when
>waitting for one process to finish, the whole lot of tools i can
>purchase..and ofcourse.. GAMES. But the shit thing is.. when i get

Games? I used to play xpilots a great deal (a neat multi player graphical game for UNIX systems with XWindow). The ID games Quake and Doom are developed under UNIX. (Doom was originally developed on a NeXT, and Quake is done using GNU tools, i.e. the GCC compiler).

I have played multi-player internet-based games under UNIX since 1989. Imagine this: It's 1990 and you are playing a game of xtrek on a 1280x1024 19 inch display in a window that covers most of it. What sorts of games were PC users playing at that time? Some single player bit-mapped crap in 320x200, or 16 color EGA, no doubt.

>some assignment.. lets say in VB , i would really wish that scripts
>would work in windows.. it's just whole lot more easier.. than to
>look through the On-line help.. which speaks in a language only the
>person wrote it would understand.
>
>I was told that Unix has a version with GUI . I can only dream of
>getting a first hand look at it.. since my country is always slow when
>it comes to IT.

Umm, you could just try installing Linux, which is freely distributed. Linux levels the ground between the rich and the poor, and does not stop at political, social or economical boundaries.

There is plenty of commercial software for it. I have even started seeing some advertisements for a version of the common desktop environment (CDE).

Students in North America have a view of UNIX that isn't much different from yours. Unless they have installed it on their PC's or worked with it at work, all the know is the text interface. That's because the OS is used to provide low-cost efficient access to things like mail and news for thousands of students. People who run UNIX (freeware or otherwise) on their desktops have a totally different view.

[Let's try to trim these headers, shall we? Nobody in comp.security wants to read this. I'm reading in comp.lang.c, unfortunately, so I'm leaving that in.]

AUCTION NOW IN GOING ONCE, GOING TWICE, GONE STAGE
Place your bids before you miss out on these spectacular rarities!!!!

Rules and stuff:
----
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
    $1 - $5 ==> .50
    $5 - $20 ==> $1
    $20 +   ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
    If you think you may want to trade, e-mail me your trade list ASAP and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will be accepted. I would NOT reccomend sending cash, but some people seem to anyway. Checks will be held for approximately 1 week to clear. MO orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 15th.
    One final post will be made to newgroups. A bidder who is not on the update list may bid on a G1 item, but not a G2 item. Any raise to an item in the G1 or G2 phase will result in the item staying or returning to G1.

You're very right-its got to be the cross-post from Hell-I've seen it almost everywhere! As an Atari owner, I did respond to it earlier, though I don't know if it made it through all the "hype" <smile> I asked why we were seeing this in comp.sys.atari.advocacy, and that my Atari Falcons DSP-equipped audio system was on par (better!) than both other systems! :)

If you mean the old 8-bit stuff, check out http://www.emulators.com/ - home of the guys who wrote PC XFormer, the 8-bit Atari emulator. As well as selling XFormer cables to do the thing you want, they have plans available to build your own cable.

ATB, Frank.

Its all about defending your right to choose whatever computing platform you wish to use (in this case, Atari!), its about letting the uninformed masses of Bill Gates clone "wannabe's" know that we (still!) believe in the computer with the friendliest OS this side of Pluto/Neptune (has it moved back out into its reg. orbit yet?), its about drawing a line in the sand (our beliefs) and standing toe-to-toe with anyone who tries to cast doubt on said beliefs...We are the Star Wars "rebels" fighting against the Evil Empire (Microsloths aim at total monopoly) Its a lonely (but good!) fight, we fight every day, every time we flick a switch and TOS boots up...AND every time TOS is the OS that appears on a screen, thats another victory for us, the few, the free, the proud... :)

Dear friends,

is there anyone who can organize the startup software for the ATARI
SM194 monitor with expansion card?

ThanX for your help!

The ST isn't 8 bit either. He was referring to the "old" Atari 800
(XE/XM/whatever) series of 8 bit computers.
But you are right, the ST isn't old. 12 years is nothing compared to the
time UNIX (not actually a system but an OS) has been around. And what to
think about PC's... They've been around for 17 years.

Just the usula "My computer is better than yours." crap.  I say Atari
rules, someone says Macs are great, PC users says mac sucks etc ad
infinitum.  I used to enjoy a good argument here but recently it's just
full of big cross-posted threads, booring.  In fact I'm going to
un-subscribe right now.

Read the man page for bash... particularly the bits about "ulimit -u".

She has a point, of sorts - do a forever loop inside a windoze 16 prog even running on 95 - but just how do you get rid of that or worse a for(;;)fork(); ?   I've been doing AIX for a while and still don't have an answer. On big iren, I'd get a phone call in about 30 seconds take another 30 to find and kill the prog, another 30 to look up the ID and kill the owner; problem solved, no IPL, no fuss, just a minute or two of aggravation - not a system lockup and reboot. On aix the system keeps running and users still get work done just slowly. But I can't kill the damned thing.

How?? (In linux too, I anticipate doing some progery and might do it by accident).

In Linux, like in other modern UNIXes, you have the idea of process limits. If you are on a Linux system, type ``help ulimit'' in the bash shell.

You can restrict the number of processes that a user can have, and also restrict the sizes of various key memory regions (code, data, stack) of the children of any process, and also the maximum running time, and other limits. The easiest way to enforce limits for all users is to deposit a suitable ``ulimit'' command line in the scripts that get executed when they log in. Also, pay attention to the difference between soft and hard limits. Hard limits can never be raised, but soft limits can be lowered and raised.

Incidentally, I recently read of a report that Windows NT allows a process to change its own priority and thus seize the processor. A patch was sent out for it, but this wonderfully undergraduate mistake gave me a few chuckles!

Hey Eric...

Good to hear from you again, and I really hate to inform you of this, but the ST is not an 8-bit machine!

I have, however, gotton that ol' 800 working well with the disks and everything... so I'm looking to move some basic-type stuff onto the floppies for that as well.

My question is this: Does an ST have an SIO interface to hook up 8-bit peripherals? I'm getting an (Not old - middleaged) 1040ST in May.

Cya l8r,
"Merch"

 DL> Maybe he's just overworked, then. Troublemakers like you don't make
 DL> his job easier. Your school goes to a lot of expense to have
 DL> resources like that, so you abuse them.

Depends what you call abuse.

a) trying everything to bring the network down
b) play network games
c) load the machine with some hires raytracing
d) suck up lan`s bandwith by  having about 25 IE`s open

>>There are just too many little things to do getting a whole lab
>>full of NT set up, apparently -- at least a lab where students
>>come in and abuse the computers.

 DL> It is about the most hostile environment I can think of. Good thing

 DL> to various security lists before it was patched.

You may have done so, but the 3 different NT machines I had
the chance to get my hands on had not..
And not so dangerous are the bugs that are publicly known
(and will be fixed sooner or later)
but the unknows bugs that hackers keep to themselves so they have
a foot in the doorway ...

>>And I know you are so concerned about this, but I have had an NT
>>user account for some time now. But I prefer to boot into DOS
>>from my NFS boot disk... NT locks up when I try to play certain
>>games.

 DL> This is a serious error - there is no way you should be able to boot
 DL> the machine from floppy.

There is no reason why it even should have a floppy. Why not get a cheap intel box, plug in some scsi hostadapter and a scsi Zip drive.. that should make those happy that need to save a lot of data onto removable media.

DL> I'd make a special "bozo" group just for you - give you write
DL> permission nowhere, and only give you execute permission for solitaire
DL> and minesweeper.

Good job you know your system :) The internet cafe I visited had NT and we had root access. we could have turned the system upside down and inside out. (enough "manpower" was available since the 6 of us are all information science students (all differnent levels))

I guess that some/most people running and administrating some NT LAN don`t know all the bugs etc etc.. you see :(

Cya

The other day my dad made a very good point. The only reason that computers for home use are so ridiculously fast is because of the bloatware that is produced for the ibm compatibles. This is very true. To run much of the software you have to have AT LEAST 8 megs of ram AND

a pentium pro whatever. Essentially you are running a supercomputer where you shouldn't be having to. I rediscovered the atari 520 st and am reassured in my belief about bloatware and supercomputers. I use datamanager and st word writer on the st. These are fabulous programs and run perfectly well on my floppy drive driven 8 mhz 512k computer. Try running pagemaker on something similiar! For the atari I have heard of PageStream which would run on the 1meg machines. This is how it should be. You should not have to pay ridiculous amounts of money to buy a supercomputer so you can run software that is difficult to use and doesn't produce(easily) what you want.

This sort of argument works only as long as you don't think about how bloated the ST is compared to its predecessors. I remember magazine articles proclaiming that 64K was more memory than anybody would ever need, when all three of the major 8-bit computers started shipping that much (Atari, Apple, Commodore).

Also, a major factor which drives the power and memory capacity of home computers up is games. If there were any texture mapped 3D games on the ST, you would quickly discover why an extremely fast CPU and lots of RAM are absolutely required. Twenty years ago, it really would have taken a supercomputer to run something like Doom, and Doom itself is getting a bit dated these days.

From a certain perspective, both your dad and the folks who said that 64K was enough are correct. That perspective basically says that new computers are only good for running old software. However, extra CPU power and memory allow the inclusion of features in newer programs which are simply impossible to have on the older generation of machines.

Mind you, I'm not advocating program bloat. There are clearly many programs which are much larger and slower than they need to be (most Microsoft products fall into this category). But to say that all the power and memory capacity of modern computers is worthless is simply false.

If you haven't used st word writer, you should really try it. It's a heck of alot better than word for windows, and it runs in 512k. That's how software should be. This ibm compatible is an 8meg dx2 66. I can't see doing anything that possibly could not be appropriate for this machine. Word runs just fine and so does win95. People forget there

roots when they say you've got to have 32megs running at ppro 200. When win 3.x came out it was sold on 2 meg machines with sx 25 cpus. If software is written efficiently then it can still have just as many features(even though most are uneeded anyway) and run perfectly well.
P.S.
My dad refuses to upgrade, and still runs Accounting II plus, on his apple II plus. The reason being is that it's fast, it's incredibly easy to use and IT JUST WORKS! (And it's kept on working for 16 some odd years).

No doubt, but NT has an aweful lot of bugs for me to consider it
a quality product. At least compared to AS400s, from what I've
heard of both.

You must not consider *any* OS to be a quality product then. Take a look at the list of bugs for SunOS, Solaris, AIX, etc. You'll be amazed. Search the web for the list of security holes in Solaris or SunOS, if you haven't already. Check out IBM's AIX web site and browse the fixes directories. AIX 4.1.4 was unusable in the state it was shipped to us as soon as you enabled NFS. I had to download over 70 separate patches to get the OS stable for my labs. I consider all of the above OS's quality products; even NT. I don't expect any OS to be perfect.

What about BeOS or QNX? I haven't heard of many problems with
them. Still, it is pretty obvious that most of the common OSs
could have quality improved by huge amounts.

Just your imagination..

> Mike

Peter(formely sinclap)

I did what through e-mail? The only mail I sent you was an article
you posted in this newsgroup, several copies:).

No, I was not read the riot act. I was very nicely asked to not
send mail to you anymore if you did not wish it. I complied.
We have a pretty decent provider here, and after sitting in on
a few of your post, all he could say was that we needed a
moderator. I thought we had one, but somehow you have put fear
in him. If I could figure out what he did to you a while back,
fear not, your post would not apear here, nor your email arrive
at my private email address. I don't like you or any crap you
post. The other Mac advocates at least have a knowledge of their
systems and know somewhat about computer hardware. The defend
their statements with facts and admit when their wrong. You
do none of these. You, Sir, are just a shit brewer.

No, the slow server is at your end. No filtering on this end.
If your just seeing that post, you have had your head up your
ass for quite some time.

Michael

P.S. I hope everybody takes note of the new mail address for
Mr. Sinclap. It's to late to send him a Valentine, but Easter
is on its way.

I never understodd the NeXT acquisition, Apple could have bought BEOS for $300 mil and had an OS, instead they spend $400 mill, buy NeXT and still have no OS, now they have to make $400 mill in cut-backs and still no OS, in a few months they may have an OS but whats the point, by then they will have lost more and more of the market.

Schools are all going to the Wintel platform, the corporate mentality is that if it don't do Intel and Windows they don't touch it (unless its UNIX) and the home market has all but gone the Wintel way as well.   DTP publishing is faster on a Pentium Pro these days with PageMaker then on a Mac, they have little left.

Not a very fair end to a superb 10 years ahead of its time computer system. Gee sounds like the Atari 400/800 computers doesn't it? Computer so way ahead of their time, Warner didn't know what to do with them or how to sell them.   Even the ST's with TOS was fantastic machines (TOS could've still used a little more brushing up in the user friendliness area's) but they were incredible machines, the only problem, they didn't say 2 things on the case: Intel Inside and Windows Ready.   The whole world revolves are Microsoft and Intel, its really just annoying.

Curt

The BeOS would not be acceptable in its current form. It has no printing
support, a very raw GUI, applications need to be recompiled at every OS
revision, no backwards compatibility and it doesn't support key Apple
technologies. Neither purchase would have resulted in a ready to use OS.

>Schools are all going to the Wintel platform, the corporate mentality is

But NeXTStep is UNIX.

I doubt it and Apple still rules in most for money color publishing and
graphic art firms.

I'm STILL waitin' for a response. Will Mr. Sinclap admit he doesn't
know jack about digital audio production? Will he admit that the Falcon
is a cost effective and currently viable platform for digital audio
production? Will he ever post again? Stay tuned for the next chapter..

In clones, the essential problem is lack of RAM.
The newer cloner OSes are too big for their britches.
Even the relative runt 'Windows 3.1' required 8 megs
to even be usable; 4M+Win31 = Sub-ST. And even at that
level, clones are crippled. You will be depending on
the HD to allow you adequate memory to run your programs.
That will tend to make your system run at the speed of
disk.

Even Linux developers admit that too much dependence upon
virtual memory is something that will adversely effect
performance. Win3.1 was a VM junkie. The rest are worse
as they're bigger.

CPU speed is not that critical. If it is, you'd likely be just
as well serviced by a PlayStation.

Without enough physical memory, your system will never get the
opportunity to show you how slow it's cpu is.

Even a slow ST trumps a fast hard drive.

According to the wife, this DX4/100 sped up by 10x when I
did nothing more but increase the physical ram from 8M to 32M.
She still suspects that I upgraded the cpu without telling her...

Apparently they weren't paying attention to any of the HLL coded, portable, layered operating systems floating around larger systems. Niether were they paying attention to GDI's, VDI's, GUI's or multitasking.

GEM's 200K of bloat added these to varying degrees.

A part of the shift from the XE to the ST were some revolutions in microcomputer terms. An ST is not quite the souped up yet bogged down speedster that a relatively spec'ed clone would be.

A clone with a 'mere' 10x the RAM of an ST would be a crippled swapping dog. Very few GUI's would run acceptably well on mere 5 Megs.

For anything not too reminiscent of an ST you'd be primarily stuck runninng QNX, GEOS, or GEM.

Even then, once you up the ante to ~30-40x ST standard memory, you've only got a more sophisticated copy of the ST multiplied.

If you can do more than a few things at once (6 DA's you know) then 10 years of progress hasn't bought you quite that much. It's evolutionary progress at best.

>need, when all three of the major 8-bit computers started shipping that much (Atari, Apple, Commodore).
>
>Also, a major factor which drives the power and memory capacity of home computers up is games. If there were any texture mapped 3D games on the ST, you would quickly discover why an extremely fast CPU and lots of RAM are absolutely required. Twenty years ago, it really would have taken a supercomputer to run something like Doom, and Doom itself is getting a bit dated these days.

This is what $200 games consoles are for.
PC's have always been rather poor games machines, especially mindless shooters...

>
>From a certain perspective, both your dad and the folks who said that 64K was enough are correct. That perspective basically says that new computers are only good for running old software. However, extra CPU power and memory allow the inclusion of features in newer programs which are simply impossible to have on the older generation of machines.

Like what? What would it buy me that a PlayStation wouldn't deliver for FAR less?

As of yet, the best you can come up with is is games.
Just get a Saturn and save yourself the expense of a 2k games machine. You've not even bothered to attempt to explain why some PET user should dump their apps, let alone

    an ST or Amigan...

>
>Mind you, I'm not advocating program bloat. There are clearly many

Yes, exactly. If more people looked at what the big machines are capable
of, they'd know why it's useful to migrate those features down to the
desktop, and why it's silly to proclaim that a certain level of CPU power
and memory is all anybody could want.

Are you kidding me? There were no architectural innovations in the ST. It was basically a 68000 bolted to a bunch of standard peripheral devices, with as little custom circuitry as possible. It reeks of being basically the same thing as the 8-bit series, only with larger constants everywhere (more memory, larger and faster disks, faster CPU, higher res graphics).

The 8-bit was, in several respects, a much more original design. For example, the ST had a simple and boring frame buffer. The 8-bitters had a graphics controller with built-in sprite support, and a considerable amount of reprogrammability that allowed programmers to mix and match graphics modes.

Despite that, the greater CPU power and memory of the ST allowed much better games and productivity programs to be written for it. The memory size alone allowed the basic graphics resolution and color depth to be much better.

If people had stuck to writing 8-bit style programs for the ST, it would have never been worth anything. They didn't.

> A clone with a 'mere' 10x the RAM of an ST would be a crippled

Incorrect. Current versions of the major GUI operating systems don't run too well in that amount, but versions designed in the days when 4 to 8 MB was the normal memory size for new computers did.

My mom uses System 7.0.1 or 7.1 (can't remember which) on a PowerBook 100, with 2 MB RAM and a 20 MB disk. It works fine.

Only as long as you stick to using software that doesn't try to take advantage of the large memory size.

> If you can do more than a few things at once (6 DA's you know) then 10
> years of progress hasn't bought you quite that much. It's evolutionary

Atari ST desk accessories were never anything like actually having several full applications open at once.

>>Also, a major factor which drives the power and memory capacity of home

PCs are considerably better than consoles for many types of games. For example, mindless shooters. There's nothing more mindless than Quake, they designed it that way on purpose. And it's really good.

Quake, incidentally, requires about 8 MB RAM. This is not because the game is inefficient. It is because you can't fit the working data set of the game into anything less. There are console versions of Quake planned, but I predict that they will suffer from having to be crunched down; no console of today contains more than about 4 MB of RAM.

Besides the kind of games you can't get on a PlayStation, it would buy you the ability to run lots of serious software with far greater capabilities than you could get on an Atari.

You might not need those capabilities. If so, don't buy them.

>   As of yet, the best you can come up with is is games.

I don't intend to. I have at no point attempted to state that people who are happy with what they've got should change. I am merely trying to point out that being happy with what you've got doesn't justify slamming newer software and hardware. It's a strange thing; for some reason people seem to feel a need to justify their ownership of an orphaned computer by trying to prove that it's better than anything ever made.

When you try to lambast something, it helps if you get some basic facts right:

Operating systems do not force programs to use more resources. It would be a very odd operating system which effectively told a program "use more of that disk, or I kill your process now!".

Comms programs don't take up 5 megs. The terminal program I use, ZTerm, uses a grand total of 440K of RAM. I think that's fairly close to what STalker, my term program of choice on the ST, used.

Word processors don't take up 20 megs. Even Microsoft Word 6.0. (5.1a is actually very compact, running in as little as 512K.)

Then you're back to running ST caliber applications. For that
you can just use older ST's and Amigas.

There is no point in handing over your firstborn for a system that
wont be a significant upgrade from what you already have.

Then please give a counter example. The above were refering to
Procomm+ and Qmodem as well as Word Perfect and Word 6. Perhaps
you could indicate what nifty things those things do that our
poor Ataris could not do. Or perhaps point us to more austere
solutions that might grant us similar benefits.

At this point it would appear that we either get to cripple our
machines running the latest and greatest or end up running warez
that are no more impressive than our own.

In other words, you agree with my central point. Desirable features can
be added to software, at the cost of increasing size and CPU usage. So
why the hell did you ever start arguing with me? Some perverse need to
naysay anything I write?

OK, I read. You said "A part of the shift from the XE to the ST were some
revolutions in microcomputer terms". I can't interpret this as talking
about software exclusively, because it's such a vague sentence. If you
want to fight illiteracy, learn how to write in a clear and understandable
fashion.

>[Hardware tangent deleted]

What you deleted was by no means a tangent. It basically pointed out that
what made the ST cooler than the 8-bits was software. Software which was
made possible because the hardware had more CPU cycles and bytes.

In other words, I was backing up my original message: that each new generation of more capable hardware leads to the development of software which uses it to add new features.

>>>   A clone with a 'mere' 10x the RAM of an ST would be a crippled

>
>   I wouldn't put up with System 6 on that small a system.

So what? For what my mom does with the machine (essentially it's an electronic typewriter), it is fine. 1MB of free memory is enough to run plenty of useful programs. If you had half a brain you'd realize that what I've been trying to say all along is that different people have different computing requirements. The article of mine to which you so vociferously objected said, more or less, "don't bag on the guys who want the new hardware, they may actually need it for something".

>   Win/Mac users have learned to put up with a lot of crap
>   for they don't know any better.

Cut out your own crap. I'm really sick of your constant attempts to paint anybody who uses Windows or a Mac as sheep who don't know any better.

Except that when you load it as an accessory, it sticks around forever. You can't quit it to free up its memory. There really isn't any fundamental reason to have accessories. Allowing multiple open applications does the same thing, without forcing the user to decide ahead of time which programs to use simultaneously.

Photoshop. Digital video effects editing. Migration of more and more low-end DTP features into regular word processors. Etc.

>>You might not need those capabilities. If so, don't buy them.
>
>   Before we buy them, it might be nice to know what they are?

Oh, come on! Why do you think Atari put a DSP in the Falcon, and the capability to have 14 MB RAM? Just to sit there while people ran old ST programs faster? Or to allow a new generation of programs which used the DSP to do interesting things?

Modern PCs and Macs have more pure number-crunching power than the Falcon's DSP and CPU combined. Do you honestly deny that this enables them to run software with cool new features?

>>I don't intend to. I have at no point attempted to state that people who

>   to see how those Fujvocactes are wrong...

Don't look now, but "substantive counter assertions" is a fairly funny oxymoron. Made even funnier by the fact that you use it in a sentence which is a bald assertion.

>   You can't even rationalize your own purchase.

I don't have to. I'm comfortable with the fact that I bought it because I like having a fast computer to play with. From a perfectly rational standpoint, I don't need a home computer *at all*. But computers are my hobby and I intend to make a career out of designing computer-related systems. So, I have an expensive toy. It's probably no worse than if I was addicted to model aircraft instead. (Actually, I suspect I'd spend much more money if I was into that.)

[much snipped because I frankly don't care]

I am not a "MacVocate", a term you seem to have invented to try to insult
opponents into submission. Even if I were, agreement would not be
required: cold, hard facts speak louder than empty-headed idiots. ZTerm
and MS Word 5.1a can each be run if you have about 1/2 meg of free RAM.
That is a fact, no matter how much you try to deny it.

I am not going to respond to this thread any more. Get in the last word
if you feel that makes you win. I am not going to waste any more of my
time arguing with an asshole whose main purpose in life is to propagate
flamewars by being deliberately bullheaded.

Taking the 3 highest offers for:

3 Atari Video Pinball Units
Model Number: C-380

Units are cream colored versions, all are in working order. Limit one per
inidividual please.

To view one of the 3 Video Pinballs, please go to:

member.aol.com/cvendel/vaporware.html

Please make all offers before 3/1/97. $5.00 shipping will be added onto
each unit for shipping.

Bloat does not necessarily imply any added functionality.
That is the trap that you appear mired in. Furthermore, I
specifically stated that the benefits when going from XE
to ST were much more drastic than going from ST to PC. The
ST sits somewhere around the threshold for an effective GUI
based machine and OS. The next 'leap' has yet to be made at
the user level. Any extra benefits a PC might bring are slight
enhancements to what the ST already has.

Their value when compared to required expense are rather dubious.

An XE can be fitted with cpu accelerators and large amounts of
RAM (512K). The hardware differences are not as extreme as you
seem to believe.

>>   useful in this respect.
>
>Except that when you load it as an accessory, it sticks around forever.
>You can't quit it to free up its memory. There really isn't any

Memory is not such a problem on the ST. With relatively little
expense, you can have more memory than you can waste.

>fundamental reason to have accessories. Allowing multiple open
>applications does the same thing, without forcing the user to decide ahead
>of time which programs to use simultaneously.

A users typical working set is not such a hard thing to deterimine.
It is a minor inconvenience and not something worth the expense of
a new system if the current one allows necessary work to be done.

>
>>>Besides the kind of games you can't get on a PlayStation, it would buy you

>low-end DTP features into regular word processors. Etc.

Everyone doing video production, raise your hand...

What DTP features? Why do they trump what's available for the ST?

Why not just run PageStream instead (or Calamus)?

>
>>>You might not need those capabilities. If so, don't buy them.
>>

New computers are expensive and don't always live up to their
hype. WinMacs crippled by overgrown OSes do give Fujvocates
cause to snicker.

Snicker, snicker, grin, grin:) he,he,he.
Look at that funny box daddy. why is that man
yelling at the windows. I can see through them ok:).
Daddy, Tommy says I can't use his Mac because his
dad said it is too expensive and not a toy.

And I watch my 13 yearold and his friends design
their science project on his humble Falcon 030....

And replace o/s with BS (BS for "Betriebssystem", which is "operating
system" in German) - this seems apropriate in English as well 8^).

Simple - Sinclap has this incredible knack to go very silent when
it becomes very obvious that he doesn't have a clue regarding Ataris,
or perhaps everything, and shuts up for a period in order to make sure
he doesn't make a bigger bozo of himself. Especially last year, when he
attempted to dis Calamus SL as being "crap" - and then admitted after
some prodding from me that he hadn't ever used Calamus, and his
experience with an Atari computer goes back to around TOS 1. He went
strangley silent for the longest while.

In the old days computer magazines were filled with source code and
whole sections involving how to take apart your floppy drive and clean
it, then put it back together again. Did they think we were smarter
then? Nowadays these same magazines are garbage. They downplay

anything that isn't this month's state of the art equipment as being obsolete and worthless. That's rather insulting to a proud dx2 66 owner with 8 megs of ram. What is it with the dumbing down of computer magazines?

Please explain, enquiring minds want to know.
Dan

The WILD & WACKY ATARI MEMORABILIA AUCTION #1

Rules and stuff:
----

1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
    $1 - $5 ==> .50
    $5 - $20 ==> $1
    $20 +   ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
    If you think you may want to trade, e-mail me your trade list ASAP
    and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
   Everything has been tested except the Intv carts.
8. If you only want an update for one particular system or want to be taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will be accepted. I would NOT reccomend sending cash, but some people seem to anyway. Checks will be held for approximately 1 week to clear. MO

orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 8th.

One final post will be made to newgroups. A bidder who is not on the update list may bid on a G1 item, but not a G2 item. Any raise to an item in the G1 or G2 phase will result in the item staying or returning to G1.

: isn't this month's state of the art equipment as being obsolete and
: worthless. That's rather insulting to a proud dx2 66 owner with 8 megs
: of ram.

Right on, bro! I have the same thing (well, I have a dx4/100, too, but that's not much better).

: What is it with the dumbing down of computer magazines?

The market has changed. It's gotten younger. Games attract kids, right? Especially those that look really good. Have you ever seen kids around 11 or 12 flipping through a computer magazine? They often go through ranking games on how they look. They hardly stop to read the reviews in many cases. So, for example, even though Nethack is much better (IMO) than Diablo, you rarely hear people complain about Diablo being such a cheap knockoff of Nethack because Diablo looks better.

So the result is that if a game magazine is flashy and contains more gloss than the others, it wins. For example, PC Gamer's biggest issue, their December 96, was apparently more than half advertising. You pay for 400 pages of magazine or so and get about 150 of content. Well, programming and technical information _isn't_ glossy. It _isn't_ falshy. It _isn't_ easy. So the obvious thing to drop when you're going for an audience that cares less about content than surface is the technical stuff.

This really bothers me, though. I look back at my old Analog Computing issues, and love them except for the fact that they mostly don't apply anymore because they're so old and the equipment so out of date. Unfortunately, many modern computing magazines are so focused on what sells that they forget content.

I don't know what modern "developer" magazines look like, but I suspect that it'd be the opposite of what I'm looking for; people who are not so much hackers as they are card wallopers who made a big effort and did something possibly notable (see The Jargon File for definitions of both). I don't want high end content indigestible for all but the high end, I want high end content written so that everyone can understand and become interested. That's the only way we'll ever break free of the horrible restraints imposed upon us by those (like Micro$oft) who think they know better.

I think the thing I liked best about the old magazines was that they instilled you with a sense of freedom. If you didn't like an aspect of a program that they provided, you had the source code. You could change it. You wern't restricted. Now people make a big thing of being able to create new levels and change some aspects of the game. It's horrible that it's been reduced to this level, but hopefully someday this nightmare will end.

Daniel F Boese <boese@badlands.NoDak.edu> writes:

>

You may have a point in saying that Win95 doesn't suck, but you really need to get your facts straight before you post something like this to a group like this. You have some major facts wrong:

>   3.   Upgrade your motherboard to dual Pentium Pro 300s.

This is simply wrong. You may have a motherboard that is upgradeable to dual processors, but Win95 won't take advantage of it. If you do add a second processor under Win95 the only thing the processor will be doing is sucking up power. Also, a Pentium Pro running Win95 is acutally slower than a straight Penitum running Win95. The reason for that is because Win95 is a 16/32 bit OS, major parts of Win95 are 16bit. Penitum Pro's are true 32 bit processors. This means that a Pentium Pro has to emulate a 16bit processor to run 16bit code. This make the Pentium Pro slower when running 16bit code.

Now if you did want to use two Pentium Pro Processors, you could use Unix, OS/2 MP, or if you wanted a MS OS Windows NT. Windows NT has the capiblities to use two Processors, and since it is a true 32bit OS it will run faster on a Pentium Pro than on a Pentium. The downside is that many older DOS and windows based programs won't work under NT.

>*Windows 95, Microsoft, MS-DOS, W95 are all probably registered
>trademarks of Microsoft Corp.
>

Well just to end this, I don't mean to nit pick but you did have several of your facts wrong. I just wanted to point out that ALL OS's SUCK. In one way or another, they all do. No "perfect" OS will ever be made, so don't take it personally when someone say's your OS sucks, it just sucks for them.

orders will be sent out right away.

10. This auction will go into the G1,G2, SOLD phase at midnight March 8th.

One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

A primary reason some OSs don't have publicized holes is simply that they haven't been subjected to wide attacks yet. The more they show up on the Internet, the more holes will be made public.

: : then?

I agree 200%!
It's not just the Magazines!
The user manuals (if you even get one) are simple plug and play phamplets. They tell you nothing about the "language" a device uses...commands, or anything along these lines...so If you want to use product X with computer Y, you can't build your own drivers and such without paying big bucks for a "development" kit!

Not to long ago, I purchased an Epson AL100 laser printer to hook up to my Atari STe (now a falcon). This little printer could easily prove a valuable addition to a Unix set-up since it is very "networkable". BUT it came with two disks...one for MS-DOS, and one for Windows which contained the drivers and set-up stuff. I had to write Hewlet Packard and pay almost $200 for a PCL 5 kit to write drivers to take advantage of this nice little printer! Yes, there were some HP Laser drivers around that would work with the printer, but none that took advantage of the cool "laser printer features" like soft-fonts, power save, toner save, memory compression, etc...

Several years ago, I got an Epson LQ, and the manual contained every code, and an explination of how it worked! If one wanted, he could send codes or write drivers on his own that'd make this little printer sing!

BTW, am I missing something...
I recently got a brand new IBM Aptiva with a 200mhz Pentium processor. It came with Windows 95...and I can't seem to find a basic interpreter, a logo program, or anything for making basic little custom utilities! Maybe it's there...but I can't find it to save my life! Maybe if Win 95 came with a manual that explains anything that isn't "OBVIOUS".
Do they think people are to stupid to write scripts and programs?
Do they think there's no need?
Nah...more like they'd rather bleed us dry...make you have to buy an expensive compiler/kit or hunt down some commercial made utility that "might" do what you want for a "moderate" price!

BTW, I still use my Falcon for real work...
I simply wanted more multi-media access, which the Falcon just can't deliver. I looked at a Mac...but the places I looked weren't at all serious about selling one to me. They had no litereature about the systems that I could study, and no one working at the Mac dealers I tried could answer any of my questions. One sales guy told me to go BUY a copy of Mac World! I looked at an issue, and found nothing stating the different systems avilable, and the specs for them.
The PC guys on the other hand gave me a stack of literature that weighed in at about 15 pounds, and they were able to answer my questions...they were also willing to toss in software, swap stuff around, and make sure I got what I wanted. I think I really wanted a Mac...but after putting up with lame to non-existant "local" support on the Falcon...I decided I'd rather not go through it all over again, so I gritted my teeth and

brought home a "Big Blue - Intel Based - MicroSoft driven" PC so my wife would have a PC at home, and so I could browse the net 90's style. All said and done...I like it...it's nice to be able to talk on an internet phone, tune into real audio servers, and play high quality true color animations and video compression schemes. I don't like the price though! If decent software were out there...I'd much rather have simply gotten an AfterBurner and done this stuff on my Falcon for less than a 5th the cost of my PC! Well...such is life...I still use the heck out of my Falcon for Digital Audio...it meets my specs for now...maybe when the PC's drop "A LOT" in price, and my Falcon dies...I'll consider getting something else for the studio...but for now...can't really say I've found anything "WORTH THE COST" to entice me to leave the Falcon any time soon where digital audio is concerned.

For some perspective, consider that the very first personal microcomputer, the Altair, was sold in kit form. You got complete circuit schematics to it, and had to build it yourself. If you wanted to connect a peripheral, you would probably have to hack an interface yourself, or buy another kit. It had no OS at all, and BASIC was an extra (which many people never got). The most popular form of mass storage was probably punched paper tape, but it came with no mass storage at all. In fact, the standard Altair came with 256 bytes of RAM, some LEDs for output lights, and a row of toggle switches on front you could use to enter numbers into memory in binary format. To write programs, you had to hand-assemble machine code and painstakingly enter them using the switches.

Ever since the Altair, computers and their peripherals have been steadily changing towards consumer devices instead of hacker devices. In 1997, this means that probably 99% of HP's customer base doesn't need to know PCL 5 codes. So HP doesn't include any information about them with the printer, especially because PCL 5 is probably complicated enough to require some significant manual poundage.

Sorry to rain on your parade, but.

ALL of those operating systems run on one machine, one very personal machine. Tis not what the WWW runs on. It usually runs on some flavor of UNIX machine, such as SUN, SGI, DEC, NCR, etc., etc., etc.

But be mindful, there are us out there who have done more, 'tis not software that makes the machine, but the internal hardware and firmware structure. And MAC, AMIGA, ATARI, and several others have the wee-bitty-the-same IBM clones (clowns?) beat to death on that point.

So why did IBM win the race in the '80s?
Not because it was heavily standrad.
Not because it was easy to use.
BUT because you had to put so few parts in a box to sell a "computer".

And you can take that from someone with these experience factors...

HARRIS JobControl
NCR IMOS I-IV,IRX,VRX
CYBER
UNIX, XENIX (go fork a process!), LINUX
ATARI REV. A,B,C + DOS 2-2.5, DOS3 (HATE, STUPID, GROWL),SPARTA (LOVE)
T/S 1000
APPLE][,][+,][C (wrote a bbs on it),][E,][GS, (and some light MAC).
AMIGA (ever hear of Synabytes or TRSZ?)(Brother of iN7RuDER)

RS MODEL 100, TRS 80 coco II, RS PC-6

And as far as desktop <=$2500.00 machines go, the AMIGA is still the only REAL multi-tasking hard/firm/software machine out there. (Then why am I using a PC compat? Running Weedoze? Because I sold out to that great satan Bill the Gates.)

Zaphod B.

This guy must be smoking some good stuff.. I got my TT for less than
1/2 of this price.. I'd say about $250 would be a good price for a
system like this, shipped.

Wild & Wacky Atari Auction (Update #5)

Rules and stuff:
----
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing
   your package and adding $1 for materials - Priority stuff <2 lbs will

be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:
    $1 - $5 ==> .50
    $5 - $20 ==> $1
    $20 +   ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
    If you think you may want to trade, e-mail me your trade list ASAP
    and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
   Everything has been tested except the Intv carts.
8. If you only want an update for one particular system or want to be
   taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will
   be accepted. I would NOT reccomend sending cash, but some people seem
to
   anyway. Checks will be held for approximately 1 week to clear. MO
   orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 8th.

One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

Hate to rain on your parade, to quote a phrase.

In fact, a PC is a class of machine, not necessarily an OS. I currently use anywhere from 4 to 6 PC class machines, 486/33 to Pentium 120. Only 1 of those machines is running Windows of any flavor. The rest are running Unix, and are being used to do many things, from serving up web pages on an internal network of around 1000 machines (almost all PCs running Unix) to development work of GUIs and OS code (drivers, kernel work, etc...)

There are quite a few machines out there which are PCs running web servers, either running Windows NT, or some version of Unix.

Well Ok, I Hate My IBM windows!!!!!!!!!!!!...Now here is the thing.
I came across a Bit called GEM for ATARI PC. It's a IBM version of
the GEM for the ST. Now, I have a ST, and a IBM. I think it would be
GREAT if I could get the Rest of this GEM for the IBM. I was wondering
if ANYBODY could help. Because I have the startup and Write and Paint
disks for this OS. BUT!...I need the desktop disk! Would anyone out
there know where the heck I could get the LAST disk(s) I need to run
this thing?...I would REALLY like to check this out.

Chris Griffiths.

Wild & Wacky Atari Auction (Update #7)

Rules and stuff:
----
1. Send all bids to cvendel@aol.com
2. Send your mailing address with your first bid
3. Shipping is extra. I will calculate your shipping charge by weighing your package and adding $1 for materials - Priority stuff <2 lbs will be $3 flat. Shipping outside of US will be a little more.
4. Do NOT bid unless you plan to buy - bids may not be retracted
5. I reserve the right to withdraw any item
6. Minimum Raises are as follows:

$1 - $5 ==> .50
$5 - $20 ==> $1
$20 + ==> $2
7. Trades - Always accepted so long as its Atari or made for Atari
If you think you may want to trade, e-mail me your trade list ASAP
and I'll tell you what I'll take in trade.
7. EVERYTHING IS GUARANTEED TO WORK - Unless it says it doesn't work.
8. If you only want an update for one particular system or want to be
taken off this list, please let me know.
9. Payment should be in US funds. Checks and MO, will
be accepted. I would NOT reccomend sending cash, but some people seem to
anyway. Checks will be held for approximately 1 week to clear. MO
orders will be sent out right away.
10. This auction will go into the G1,G2, SOLD phase at midnight March 15th.
One final post will be made to newgroups. A bidder who is not
on the update list may bid on a G1 item, but not a G2 item. Any
raise to an item in the G1 or G2 phase will result in the item
staying or returning to G1.

> >inferiour mass-market systems, worldwide decadence and lamers!

Whining against the harsh reality of M$'s success in making Win95/NT and Intel-based PCs won't change a shit. But learning about all the buglets of the M$ software enough to be able to make wonders out of any PC shit and being able to debug/configure Win will help you gain the confidence of those "ignorant lamers" who bought into marketing skills of M$. THEN you show them how great an Atari is. THEN you show them how Atari has had M$ floppy/filetype format 10 years before the power Macs did. THEN you can convince them that "power without the price" really exists.

> >So for "employers" I am the "bad" guy... just because I'm different!

Read my reply above. Learning Unix also helps. Even something as basic as being able to Telnet is an important and still rare skill among those "PC lamers" on top of actually knowing the innards of Win95/NT. If you ever talk to Lonny Pursel (the guy behind AtarIRC), ask him how knowing about Unix and PC hardware helps him make a living and remain a valued member of his computer shop's employees.

> >No it isn't! It's fucking shit these days to work with computers! All
> >those morons and lamers grabbing all the best opportunities just
> >because *they* know which buttons to press on Word for Windows!
> <snip>
>
> >You can't earn a living with "doing what you want to do"!
>
> Actually, sometimes you can.

If you're lucky enough to be in an environment that doesn't single out individual and sometimes marginal choices, yes indeed. This is the case of artists like Vince Clarke of Erasure who persistently used only 20 year old anaolg synthesizers when everyone else would not settle for any less than a 64 voice multi-timbral synthesizer. But then, Erasure is selling well enough to allow Vince to have a brand new studio built for him in Belgium (or was it Netherlands?)

> >Where are the days that you could do something ALONE at your home
> >and gain respect of fellow computerusers?

They are still here. Folks coding internet software for the STiK layer on Atari are just that: closet heroes of Atari's internet ventures towards year 2000.

> * _all_ (and I mean _ALL_) Acorn stuff - Manuals, ROMS, 3rd party stuff,
> software etc be "converted" to America-speak

I don't recall there being any such import restriction. I've got this Monty Python tape here. It's hardly what you'd call America-speak. I've got a PAL VCR, too. It's got documentation in any number of non-American forms. I've also got documentation for some Japanese-made equipment that you would be hard-pressed to call English at all. :) Not to mention there isn't even any such thing as "America-speak" except in slang.

ROMs? 3rd party stuff? Is going to have an impact on importing the computer?

> * Change logo. BBC in the US stands/stood for "Brown-Boverie Coporation",
> so the "BBC" name was out

I'll believe that. A trademark is a trademark... regardless of who owns it, it's still valid in the country of registration...

> * Acorn should stop selling BBCs to any company that the US Army didn't
> approve of.

Couldn't tell you about this, I don't know.

> At the same time Acorn tried to sell in the US, Apple started giving away
> computers in California to stop the BBC sales. The FCC rules were also
> changed.

I would like to see one of these mysterious free Apple computers, or see any sort of evidence for this. I've never heard of Apple computers being given away except perhaps to peripheral manufacturers, etc.

> The BBC was based on the 6502 processor. This was on the "restricted list"
> since it was used in missile firing and control systems. This stopped the
> import of products containing the 6502 - this is how Apple sold the Apple

Yet this did not stop the EXPORT of Apple]['s to any number of countries? Nor the internal sale of such computers? Nor the import of foreign- manufactured 6502 chips for use in the Apples?

No, but the import of 6502-based computers was just too dangerous... :)

I hate to join this cross-posted spam, but the last time I used a modem under Windows 95, the program which opened the modem crashed, yet the OS (I use the term loosely, of course) would not release the device. I had to reboot the machine. NT isn't a whole lot better.

These are not systems with which you could run terabyte databases, control industrial processes in real time, manage telephone networks, etc. They are toys for home entertainment and lightweight business management.

>time I tried it on Unix I read about the nine files one had to edit,
>then gave up.   It seems to me that Unix is losing market share

Maybe you used a ``plug and play'' type modem. Would Windows NT still find the modem if it was just an ordinary external unit hooked up to a serial port, and if I changed the BIOS settings to give that port an unusual address?

Perhaps you have never used a real workstation with a real UNIX. Adding hardware devices to workstations has been a breeze compared with all the IRQ jumper twiddling of PC's. These computers have had ``plug and play'' long before it became a buzzword in the world of personal computers.

I have here a little booklet from Intel which contains a long list of errata for Pentium and Pentium PRO processors---on other words, ways in which their pathetic processors deviate from *their own* architectural and implementation specs. In the very beginning, they have a disclaimer that Intel products are not to be used in life threatening situations. If you wish, I can quote precisely. There are at least a dozen conditions cited in the book which can cause a dual processor system to lock up. This is all very convenient for Microsoft; they can point their fingers at hardware when something goes wrong.

After skimming through the booklet, I understand why Wintel boxes are so cheap. Apparently, it's not just the economics of mass marketing.

Hmm, maybe your Wintel computer's text editor is not up to the task of trimming the Newsgroups line to include only the advocacy newsgroups? I left in comp.lang.c, since that's where I'm reading this crap.

That's interesting. In OS/2 2.0 (or was it 1.3? i don't remember) If a
Rexx program abended, all open files remained open. You had to reboot to
release them.

Perhaps that's one of the reasons OS/2 means 0.5 * OS. :) After all, it's
a Microsoft product.

So what is your point? That what's passable 95% of the time should be
stretched further? 95% solutions don't always cut it. And that last 5%
is a vast canyon compared to the first 95.

Hmmm...
I thought the USofA didn't allow dual citizenship. You were either a
citizen of the USofA only, or not. Only country I know of that acts that way.

:
: Why? A PowerPC is fast enough to emulate the 030 much faster than a real
: 030. Even with Apple's original 68K emulator on the 6100/60 (60 MHz, no
: L2 cache), users saw emulation speed that was faster than a Mac IIfx (40
: MHz 030). With a dynamic recompilation emulator, I have observed

: emulation speed twice as fast as a 40 MHz 040 on a 100 MHz 601. Adding a
: second CPU that uses a different memory bus protocol adds a lot of
: complexity (and therefore cost) to the machine.

OTOH, it takes time write emulation code, a real processor allows for
total compatibility. The Phase5 PowerUp card allow access to the PPC
through shared libraries, while the main executable runs on the 68k.

: Fast emulators eat lots of memory (Apple's original emulator has a 512K
: dispatch table in ROM, and DR emulators use several hundred KB for
: translated code caches), but these days memory is cheap.

True, but never understimate the cheapness of a computer company.

: > add
: >some kickin' APIs for video and audio. TOS already has the preemptive
: >multitasking and multithreading needed, as well as memory protection.
:
: Atari enthusiasts interested in a lightweight OS that supports all sorts
: of neat stuff without incurring overhead should really look at BeOS. It's
: much better than TOS, easier to write programs for, etc. Be is no longer
: going to produce the BeBox; instead they are going to target PPCP and
: Macs. But you can get nice Power Computing machines for cheap, and
: PowerComputing is going to start bundling BeOS as well as MacOS with their
: machines.

Pios are also going to bundle both pOS and BeOS with their PPC computers.

: Somebody should write an Atari ST emulator for BeOS. (Actually, I'd like
: to see one on MacOS too. MagiCMac is nice, but it really isn't that
: compatible.)

I'm sure some BeOS programmer could convert STonX or something. =)
The Amiga Emulator is already there for Be.

: If Apple and Be hold to their current promises for OS development, within
: a year I will finally have a system I'm really happy with: a fast
: non-Intel processor with a real OS, and a second OS to hack with.

Now, if only we get something like AmigaOS...

> it on Intel.

BZZZZT! Wrong. For one thing, Motorola has no reason to "offer or support" NT on Intel - as it sells no Intel systems. As for IBM, they have dropped NT, period. So have Gateway, Dell, and Compaq. Why?

Microsoft was forcing the VENDORS to support their buggy junk. If you sold computers, would YOU want to have to spend money to keep it running junk MS OS's?

NT is now ONLY supported by Microsoft. It burnt all of the hardware makers, and with good reason, too. NT4 has been nothing but a disaster for a majority of enterprise sites, especially those that upgraded from 3.51. I have seen several clients have it crash and burn (4.0, that is). I count my blessings every day that I exited the hardware support business.

CHRP's promise was any OS on one machine, now it is just
> MacOS and BeOS...

Not true, technically. It also includes Linux and Rhapsody (Mac OS 8). Incidentally, Mac OS 8 will run on Intel machines as well, as announced by Gil Amelio at the Apple Shareholder meeting today. It should make it very easy to move to PowerPC when Intel hardware reaches the CISC limit. CW already says that the Pentium Pro will max out at 225 MHz, and any RISC chip Intel comes out with will be expensive and difficult to switch to.

>
> The NeXT merger was greeted with mixed review as well. One of the
> largest stumbling blocks ahead is that Apple has no definate plans
> for their next OS and developers are dropping out of the Mac platform
> daily.

This is also inaccurate. Apple has a very concrete plan for their OS (visit their Web page)! Basically, Mac OS 8 will be UNIX, the Mach Kernel, running with a hybrid Mac/Next UI. It will be backward-compatible with Mac SYstem 7 applications. It will run on CHRP and Intel. Since CHRP is higher performance, it will make it easy to move to CHRP from Windows NT.

Net developers in the Mac development team are growing. Developers are dropping out of Windows in droves as well. Why? They're going bankrupt. There are no "mass dropouts" of any major developers (or minor ones, for that matter).

>
> All of this news can be found in Reseller News. the pulse of the
> Computing market and Industry.

Not hardly. CRN is a rag primarily aimed toward Intel clone builders. It is hardly an unbiased source, and regularly prints factual errors. They would also be less than friendly toward Atari, to say the least.

> All the best,
> Chris @ Computer Direct

I would suggest it is better to support CHRP than to move away from it. 544 MHz PowerPC chips are going into new Macs this year. The PowerPC is preparing to go from 20% outperformance of Pentium systems to 300 - 400 percent outperformance. And Mac OS 8 is the OS that will be most familiar and comforting to Atari customers moving to newer equipment.

Any future TOS systems will also revolve around CHRP technology, not Intel.

Why Windows 95 does not suck !!!

by SabreRider

Over the past year I have heard several people make the comment that Windows 95 sucks, without even trying it. Well I�m here to tell you, as an actual user, that it does not suck.

Proof of my statement can be found by simply looking at the Windows 95 documentation! The capability to SUCK just isn�t a natively supported feature. However, for those people who insist that Windows 95 DOES SUCK, you need to do the following:

1. Increase your ram to 128 megs.
2. Free up 1 gigabyte of HD space.
3. Upgrade your motherboard to dual Pentium Pro 300s.
4. Increase your video ram to at least 8 megs of rambus.
5. Install the W95 dial up adapter kit from UND.

and finally,

6. Install the official Microsoft W95 �virtual sucking device� driver.

Be sure to backup all of your Word documents as text files so you can access them under the MS-DOS Editor program.

*Windows 95, Microsoft, MS-DOS, W95 are all probably registered trademarks of Microsoft Corp.

** Pentium Pro is probably a registered trademark of Intel

Hey, just reporting what the "Industry" is reporting. If this news is as you say, BZZZZT Wrong, then perhaps if you care, you should grab a copy of Reseller News for yourself and follow up on it.

Regardless, the "Industry" "feels" Mac/Apple is dying a slow and painful death along with PPC. This is what they are reporting and as you know, if the media says something long enough, people believe it.

This of course is not how I "feel" about the situation, just how it is being perceived by "most" resellers in the industry, including Apple resellers.

Apple developers are not lining up to dev for the new OS'. Even Adobe has not made any solid committments past System 7. If they have, show me the press release.

All the best,
Chris @ Computer Direct

If Reseller News is reporting that Motorola is dropping PPC and going to
Windows NT on Intel, it wouldn't surprise me. CRN is primarily an
Intel-based rag and primarily caters to Uncle Joe's Computers and
Toasters, Inc.

I am soon to be an Apple VAR, and have resold Apple products in the
past, from Internet servers to small networks. I also sold many TOS
systems for smaller businesses. I know the market, and know that demand
in my neck of the woods for Apple technology (espcially Internet servers
and related Internet technology) is wrong.

> Regardless, the "Industry" "feels" Mac/Apple is dying a slow and painful
> death along with PPC. This is what they are reporting and as you know,

> if the media says something long enough, people believe it.

That's right. The Wall Street Journal and various other "publications" are going gung-ho, writing articles that have no merit or basis in fact. I read an article in the WSJ yesterday that said "analysts believe Apple is fading fast." Of course, he only cited ONE analyst, who said "Apple still has some problems to overcome." Analyst (singular) is far different from analysts. It also said that Apple had not unveiled any new products in "several years" and that Mac clones were poor sellers.

The Wall Street Journal also said that Chrysler Corp. was doomed in 1991 to bankruptcy. Seems that today, Chrysler is dominating the auto industry.

Most of the Finance types writing this stuff don't bother to research the technical aspect of what they're doing, and focus on the Income Statement rather than the Balance Sheet. So they say Apple is dead (despite a net reduction in debt of $650 million and increase in cash reserves of $700 million last year) because of net income. And they recommend investing in a profitable Commodore International Ltd. in 1991, when the firm was choking under $200 million in debt, with only $65 million in cash, because it had a good profit year.

>
> This of course is not how I "feel" about the situation, just how it is
> being perceived by "most" resellers in the industry, including Apple
> resellers.
>

Again, you have no quantifiable evidence of this. If it is garnered from CRN, it is garnered from a publication that caters primarily to Intel/Windows resellers.

It's like me reading an article from the Bandito in Amazing Amiga mag about how horrible the Falcon is compared to the Amiga 1200, and saying that "major industry publications say the Falcon is weak for multimedia and really nothing special."

> Apple developers are not lining up to dev for the new OS'.

Wrong again. Take a browse through the Rhapsody web site to read all of the commentary.

Also, considering that Rhapsody ALPHA isn't even shipping yet, how can anyone commit to developing for it with absolute certainty? How many press releases lauded Win95 and committed to it? Not many, as there are fewer 95-only applications than Mac-only.

Even Adobe
> has not made any solid committments past System 7. If they have, show
> me the press release.

You're incorrect here, as well. Head over to the Rhapsody site and do
some reading (if you're truly interested).

>
> All the best,
> Chris @ Computer Direct

Another interesting twist - Apple's customers are different from the PC
clone makers, who sell to business in volume and video-game playing
consumers in volume. In the media markets where Apple reigns supreme,
it has strengthened its lead. Sales of high-end Macintoshes and
PowerBooks are up too. The sales decline in units is entirely in
low-end Performa systems. So in the markets that Apple markets too,
resellers are overjoyed (other than the low-end ones).

Because Atari aimed for the wrong markets. It downplayed its video-game association, aiming for the business market (which didn't accept the pricey Mega and hated the ST keyboard, as well as Atari's name credibility), the publishing market (where it made huge inroads, but Atari quit after six months when it became obvious that to compete, development and promotion would be involved), the MIDI market (where the remaining STs in use are), and the "Atari Revolution" buyer (who bought whatever Atari put out, no questions asked.

Since Tramiel was simplistic in his business thinking, rather than develop and minimally market the ST/TOS series to compete in media markets and creative areas where Atari's name and technology were respected, they decided instead to milk the loyal userbase that they had inherited from Atari, Inc. and the early success of the ST based on technology. When that shrinked to an unprofitable point, they dropped it (along with developers, retailers, and users), lying about intent to support and develop the machines to sell off remaining inventory. Then they simply went off to stun the world with technology yet again with the Jaguar. However, when Tramiel realized that a video game system would have to develop and minimally market the Jaguar to compete in media markets and creative areas where Atari's name was still respected, they decided instead to milk the ST userbase, who had bought orphaned Lynxes and Falcons made for a whole six months in North America. When it became clear that most users didn't want to be screwed a fourth or fifth time, Atari folded into JTS and screwed Jaguar developers, retailers, and users. (See a malicious pattern? It was also found at Commodore in Tramiel's days there, with the VIC 20, Plus-4, C16, and other "winners.")

What a history, what a waste. Atari, even up to 1993, had the chance to change the world. Instead, they blew it and took the easy way out. . . corporate death.

Oddly enough, John Warnock, Adobe's CEO, appears to feel exactly the
opposite way about Rhapsody (the new OS). Load up this URL:

<http://product.info.apple.com/pr/press.releases/1997/q2/970107.pr.rel.dev.html>

Quite easily, actually. Apple's announcements state that OpenStep will be
kept completely intact in Rhapsody. Their developer pages indicate that a
valid early development strategy is to buy a copy of OpenStep for the PC
and write an application for it.

Adobe has some nice looking products, but........
i'm one of those spoilt little bast�*ds whose
employer pays for his Mac software. I just got
Adobe Primeier 4.2.x and am not all that impressed.
I'm glad it wasn't my money. Photoshop is a pig, but
does do a nice job. i think it looses a little in
the translation however when run under the Mac O/S:).

Now Bryce2, that's a bitchen app. If you haven't seen
Apex Media or Rainbow Multimedia on a Falcon, the
Bryce interface will give you a good example.
To bad Bryce2 is also available for the PC.
I can still purchase quality apps and use a Hades
with a Pentium card. Screw the cost.

Mike

Yup, Get mint with minix or magic with VFAT.
That will work. bye :)
However the desktop from thr ROM can not display the longfilename
correctly.
You woudl need an alternative desktop.
However Magic comes (I believe) with it's own desktop.

Use MiNT and MINIX filesystem
it works very well for me on my ATARI ST, ATARI STE and FALCON.

Well, you could either get Magic which uses the Windows 95 VFAT filesystem
(crap, crap, very crap) or you could get MiNT with Minix and have a proper
filesystem which is very, very fast. Both offer long filenames. Magic costs
money, whereas MiNT and Minix can be downloaded from any good Atari FTP site.

Cheers,

James Cox.

Are you into HOT CHAT? We've got the world's largest voice-personal dating system, as well as the hottest, sexiest "1 on 1", "2 on 1", and "PARTY-LINE" chat you'll find anywhere, all in one place! And you don't have to call a 900 number to get in on this hot phone fun!

You can choose from 5 hot programs that are sure to fulfill your every desire!

You can press 1 from the main menu to choose from our sexy "1 ON 1" PLEASURE MENU, then:
*to talk to a BEAUTIFUL SEXY GIRL, press 1.
*for a 1 on 1 session with an experienced DOMINANT MISTRESS, press 2.
*for steamy talk with a LUSCIOUS TRANSVESTITE, press 3.
*for an erotic 1 on 1 chat with an EXOTIC TRANSSEXUAL, press 4.

*for some man to man action with a HOT GUY, press 5.
You'll be billed just $3.99 per minute for your selection.

Or you can press 2 from the main menu to DOUBLE YOUR PLEASURE, then:
*to speak to 2 HOT SEXY GIRLS, press 1.
*to get it on with a swinging WILD COUPLE, press 2.
You'll be billed just $4.99 per minute for your selection.

Or you can press 3 from the main menu to join the GROUP ORGY LINE!
*You can party with the nations nastiest swingers for only $2.50 per minute.

Or you can press 4 from the main menu, then:
*Press 1 to join the FANTASY NETWORK. This is the world's only phone service that allows you to connect with people who share your personal fantasies. This state-of-the-art voice mail system lets you listen to messages from beautiful girls, sexy transvestites and she-males, gay and bisexual males, and dominant women. Leave them a hot and sexy message, then call back to see what erotic message they have left for you. You'll be billed just $3.50 per minute.
*Or press 2 to listen to a hot selection of recorded fantasies steamy enough to make you explode! Choose from beautiful, sexy women's fantasies or domination stories. You'll be billed just $2.49 per minute.

Or you can press 5 from the main menu for the HOT AND NASTY DATELINE, where you can listen, and respond, to voice personal ads from hot horny girls in your neighborhood, including their real names and home telephone numbers! You can also leave your own personal message for people to get in touch with you. Make new friends on the world's busiest voice personal lines! Meet singles or couples, gay or straight; you'll be billed only $2.99 per minute.

***JUST CALL 1-800-756-3906 to use your Mastercard, Visa, or American Express card. The charge is just $2.49-$4.99 per minute, plus a 50 cent connection fee. 18+ only.

***OR CALL 1-900-745-4398. The charge is just $2.49-$4.99 per minute. Must be 18 years of age or older.

Call now!!! YOU WON'T REGRET IT!

Thank you for replying. Just found this group tonight and saw both posts. I dug out the ST 520 and hooked it all up. Works real well except there is a problem with the B drive, which apparently has always existed. I think it said something to effect of can't read from drive b or something. At any rate I was fascinated by the basic language sourcebook since I am into the variations of basic programming. As near as I can tell this was Visual Basic before Visual Basic. Mr. Bill sure copied alot of the features, drag and drop, resizing of windows, etc...
Incredible that atari apparently blew it the way they did.
Ah, pity that.
Dan

I think I can forgive you this time around. As you can see so far I am still alive and well. Thanks to Phil for lending me his old Mega ST4 and Megafile 30.

It will however be at leat 2-3 months before the police investigate the matter any further according to my solicitor.

No kidding! Atari had it ALL. Long BEFORE anyone else... and they
had/have the BEST implementation of it...

Now my friend an I are running Linux on Falcon030's ;)

In Singapore, it's worst!

The government have a proxy which filters out everything going into Singapore. The government is said to have 5 full timer surfers in the NCB (National Computer Board) whoose job is to search & locate porn sites and add them into the no-no proxy list so that they are blocked.

Last year, a guy was caught by the law for possesion of porn stuff in his harddisk. He was fine over S$50K (S$1.4 = US$1) for 66 pics, I think it was like S$1K per pic, couldn't remember.

William

Sorry, this is most definitely *not* false information. As a 25-year industry
professional working as an AS/400 systems programmer since 1988, I've
contacted quite a few AS/400s at sites of all sizes. Such things as service
account passwords are often ignored or maintained only by the IBM CEs.
Many CEs use the same password at different sites within their territory.

And the accounts he's referring to have no relationship to IPL *nor* the console.

I wonder what happened to Mr. Sinclap? I wonder why he hasn't responded
to my post?

There have been a few new people to the group, and they sure sound
like they have the same flavor as Sinclap under a different name.
Especially all the people wanting TOS images and willing to argue
about getting it. The guy that thinks he is talking about Atari ST's
and seems to be talking about 8-bit machines comes to mind....
I fear he still lurks...dundunt dundunt dundunt dundunt dundunt

Mike

IBM plugged these gaps on most of their OS's long ago. Today, the installation
passwords expire in a few weeks and will leave you _totally_ locked out
if you forget to change them.

As for how an individual _site_ manages all of this, that's a different
matter entirely. Discovering that many sites give service machines the
same password as their machine name is no surprise at all and has no

bearing or reflection on IBM. Talk to the security people at the sites mentioned above and I bet that they either: 1) Do not exist or 2) cannot spell 'computer' or 3) have no idea that a 'CE' even exists (much less that a 'CE-Key' exists...

Most security problems are actually internal organization problems, not 'holes' in the OS.

Yeah, I just recently saw the docs on the VFAT fs in some Linux Howto
file... Tjeez! It's a classic Crap Microsoft Backward-compatibility Patch!
It uses additional entries in the dir table which are sort of masked of from
the normal DOS fs to store additonal characters for the file name. That's
why W95 locks it's filesystems: to prevent properly written programs like
Disk Doctor from messing up (ie. fixing) the "crap" extra dir entries...
Unbelievable...

I suppose nobody tried to telnet to port 135 under NT,
typed about 30 characters and then pressed return and closed
the telnet session again.

And then watched the load on the machine go up to 100% almost locking
the machine..

But that might be fixed now. but things like these can bring down
systems :-((

Really? It still works on the NTs in the lab. Could you do me
the favor of telling Microsoft for me, so they can fix it?

Why don't you look it up yourself?

Better yet, here, I'll post the text file for you.

DOCUMENT:Q162567   [winnt]
TITLE   :Telnet to Port 135 Causes 100 Percent CPU Usage
PRODUCT :Microsoft Windows NT
PROD/VER:3.51 4.00
OPER/SYS:WINDOWS
KEYWORDS:kbnetwork kbbug3.51 kbbug4.00 kbfile

The information in this article applies to:

 - Microsoft Windows NT Workstation versions 3.51 and 4.0
 - Microsoft Windows NT Server versions 3.51 and 4.0

SYMPTOMS

When a client uses the telnet utility to connect to port 135 of a computer running Windows NT Server, and then types more than 10 random characters and disconnects, the server CPU usage jumps to 100 percent and does not come back down until the server is restarted.

CAUSE

This problem is caused by a problem with the remote procedure call (RPC) components in Windows NT.

RESOLUTION

To resolve this problem, download and install the appropriate file:

Windows NT 3.51

This hotfix has been posted to the following Internet location:

ftp://ftp.microsoft.com/bussys/winnt/winnt-public/fixes/usa/NT351/
hotfixes-postSP5/rpc-fix

Windows NT 4.0

This hotfix has been posted to the following Internet location:

ftp://ftp.microsoft.com/bussys/winnt/winnt-public/fixes/usa/NT40/
hotfixes-postSP2/rpc-fix

STATUS

Microsoft has confirmed this to be a problem in Windows NT version 3.51 and 4.0. A supported fix is now available, but is not fully regression-tested and should be applied only to systems experiencing this specific problem. Unless you are severely impacted by this specific problem, Microsoft recommends that you wait for the next Service Pack that contains this fix. Contact Microsoft Technical Support for more information.

KBCategory: kbnetwork kbbug3.51 kbbug4.00 kbfile

Good enough?

Maybe you should tell your NT sysadmin about this fix.

As I recall, a fix was available less then 24 hours after the problem was reported.

The only other OS I can think of that gets fixes this quickly is Linux. :)
(BTW Linux rocks!)

Darwin Ouyang

I am selling my Atari Lynx and the following games and accessories:

APB
BLOCKOUT
BATMAN RETURNS
BLUE LIGHTNING
CALIFORNIA GAMES
CHECKERED FLAG
CHIPS CHALLENGE
ELECTROCOP
GATES OF ZENDOCON
GAUNTLET
HARD DRIVIN
HYDRA
KLAX
MS PACMAN
PAPERBOY
PINBALL JAM
PIT FIGHTER
ROADBLASTERS
ROBOSQUASH
RYGAR
S.T.U.N. RUNNER
SHADOW OF THE BEAST
SHANGHAI
TODD IN SLIME WORLD
STEEL TALONS
VIKING CHILD
WARBIRDS
XENOPHOBE
ZARLOR MERCENARY

AC Adapter
Car Adapter
Deluxe Carrying Case
```

Bid High to make sure of recieving games! I will knock down price for people who buy more!!

To check on current bids, check out my page:
http://msm.byu.edu/complab/joshuam/lynx.htm

Bids and questions to: 0jmorrel@msmlab.byu.edu

The Lynx II comes with the Original box. All games come with Boxes and Manuals. I am conducting an auction, so the highest bidder wins. Bidder will send me a money order for shipping and merchandise before items are shipped.

Welcome to my Atari Lynx Auction page!!
I am currently conducting an auction of the following Atari Lynx items. I will post all bids daily, so keep checking my page often!!
All games come with boxes and manuals. Here are the games:

APB $5.00
BLOCKOUT$5.00
BATMAN RETURNS$5.00
BLUE LIGHTNING$5.00
CALIFORNIA GAMES$5.00
CHECKERED FLAG$5.00
CHIPS CHALLENGE$5.00
ELECTROCOP$5.00
GATES OF ZENDOCON$5.00
GAUNTLET$5.00
HARD DRIVIN$5.00
HYDRA$5.00
KLAX$5.00
MS PACMAN
PAPERBOY$5.00
PINBALL JAM$5.00
PIT FIGHTER$5.00
ROADBLASTERS$5.00
ROBOSQUASH$5.00
RYGAR$5.00
S.T.U.N. RUNNER$5.00
SHADOW OF THE BEAST$5.00
SHANGHAI$5.00
TODD IN SLIME WORLD$5.00
STEEL TALONS$5.00
VIKING CHILD$5.00

WARBIRDS$5.00
XENOPHOBE$5.00
ZARLOR MERCENARY$5.00

Check out Kurt Olson's Lynx page for reviews on each game!!
[Image]Click here!!!

I also have the following accessories for auction:

Lynx II	$5.00
Deluxe carrying case	$5.00
AC Adapter	$5.00
Car Adapter	$5.00

Bid high!! If you buy more, I will knock off some from the price!!

Please send all bids or questions to:
0jmorrel@msmlab.byu.edu

I reserve the right to make the final decision on selling price. I will calculate shipping, and buyer will send me a money order for shipping and equipment before they are shipped.

Why don't you print or save this info in case you need it in the future?

Hello Friends,

It's time to take full advantage of the online medium by having your photographs scanned today! Once your pictures are scanned into one of three formats (GIF, JPEG, or BMP) you can do many exciting things with them.

-You'll easily be able to attach them to emails and send them to people your chatting with online. No more having to try and explain what you look like!

-You can also use your photos in all kinds of fun projects: build web pages; design your own greeting cards; make personalized stationary,desktops, and screen savers- the list is endless!

- Scan pictures of yourself, your pet, your vacation, or whatever you choose!

Cyber Services will scan ANY photograph, drawing, magazine clipping, or other artwork to an image file, and email or US mail it (on disk) back to you within 24 hours of its receipt. (You must be able to receive file attachments to get your file(s) via email. Check with your ISP if your not sure.) PRIVACY & CONFIDENTIALITY ARE ASSURED. You'll also receive helpful technical tips on everything from renaming your file to saving time when sending it to people via email.

We scan all our images in 16.7 million colors for best quality. For just $1 extra we can enlarge or crop your photo, blur out a body part, or ad text (such as your name or email address).

Best of all, as a FREE GIFT to you (limited time only), IF YOU CHOOSE TO, we'll reserve you a FREE PAGE (or pages) in our "Internet Date-Site" (Now under construction!!!). This web site contains pages classified by local area and sexual preference. There's also a erotic image gallery (must be legal age to enter), and a "special interests" section. That's right, you can have your own page on the internet for just $4! (Note: You're responsible for answering your dog's email!) Your free page(s) will include any or all of the following: Your scanned photo(s) (You pick which ones- You can have some, none or all of your photos posted on your page), your email address with an icon visitors can click to send you mail, and a brief profile about you. We'll remove or modify your page, at your request, at anytime! When the "Date-Site" opens for business, you'll receive an email notifying you of the address of your personal web page. You can give the address to people and they can view it from any internet connection! There are millions and millions of people on the internet.It's time you start meeting them! (This service won't be free for long so act now!)

If you have any questions regarding our services, please call us at (541)744-5718.

Ordering Information:

Price: $4 for first scan, $3 for each additional scan
Extras: $1 each to add personalized information. (name/email)
$1 each to have image modified (enlarged, body part blurred, etc..)
$2 to have image files mailed to you on a floppy disk (IBM or MAC).
$1 credit card processing fee (Visa/Mastercard users only)

If you would like your photographs returned to you please include a self addressed stamped envelope. Otherwise they will be destroyed.

Order Form (PRINT OUT or COPY CLEARLY):

Name (optional):

Email Address or Screen name (PRINT CLEARLY! You must be able to receive file attachments. Otherwise include $2 for shipment on floppy disk.):

Address (optional unless having shipped on disk):

Phone number (optional):

File type (GIF, JPEG, or BMP. GIF recommended):

Extras (Exact personalized info you want printed on scan):

Disk Format (if having mailed on a floppy): IBM or MAC

Payment method (Cash, Check, Money Order, or Visa/Mastercard):
Please make checks payable to Cyber Services.

Credit Card # (credit card orders only):

Expiration date:
Don't forget to include the $1 processing fee if your paying with your credit card.

Do you want the FREE GIFT?   Yes   or   No   (circle one)

-Web Page(s) in our "Internet Date-Site" (under construction). You can have a page for yourself, a page for your car, and a page for your cat! Be sure to indicate where you want your page (F4M, M4F, F4F, F4M, or Couples) and which of the following info you want on your page (print clearly): State and Town, email address, year or birth, physical description, quote/message (under 30 words please).   Please indicate which photos you want on your page (if any) if you don't want them all to be displayed. If your want your nude/erotic photos displayed in our erotic image gallery YOU MUST include a signed statement that your are over 18 years of age or older and give us consent to display your nude/erotic photo, and be sure to tell us if your want it displayed with your info or anonymously.

Mail the above information and photos with payment to:

Cyber Services
2852 Willamette St. #131
Department 1
Eugene, OR 97405

Orders sent overnight will be given first priority.

Erotic/Nude photo's will be accepted providing everyone in them is of legal age.

Questions? Call (541)744-5718

Please help our small business grow by sharing this info with someone you think could use it.

Thank You!

(ZrQHpU)

>>systems :-((

 DO> I think it was fixed about 24 hours after it was reported. :)

Funnily enough, all the internet cafe`s around here (read: I have been to) run exactly that copy of NT that still has that bug :-)

Strange. It still works in the lab, even after you posted the text file. .. I thought we were talking about quality in OSs having to go to extra trouble to download fixes is not what I would call quality; my mistake, sorry.

A friend returned from Comdex and was talking about his experience. He said, in a room of new Intel processors, nothing worked, everything overheated, software froze up. He was surprised.

Talking with his friend/computer publisher who saw all this with him, he asked, 'So what will you report about this?' The publisher said: 'If I said anything much against Intel or Microsoft, I would be unemployed in a few months.'

This guy publishes Computer Reseller News out of Long Island. He knows one just doesn't criticize the money tree. Shake it when they say shake -- and the money will fall.

That's life. It may have been obvious to anyone who has tried to read the computer press these many years (in between barfs) that these experiences are typical. But they still greatly disturb. [posted 27 November 1996, submitted by Alan Thibideau]

If you could name me a single OS which has never had any fixes, then
I'd grant that you have a point.

Your poor sysadmins have repeatedly shown they really aren't very well
acquainted with NT, nor do they stay current.  Giving you more than a
guest level account is proof of this.

Actually they know NT very well -- maybe more well than you do.
The head guy has worked for Microsoft for several years,
including working on the OS (not apps).

There are just too many little things to do getting a whole lab
full of NT set up, apparently -- at least a lab where students
come in and abuse the computers.

And I know you are so concerned about this, but I have had an NT
user account for some time now. But I prefer to boot into DOS
from my NFS boot disk... NT locks up when I try to play certain
games.

A 'quality OS' can frequently have these problems...or will you suggest Linux isn't a quality OS? There are bugs and security flaws in _any_ OS. Patches fix those bugs, and a measure of the quality of the vendor is the speed at which those are addressed if they are real problems.

>Actually they know NT very well -- maybe more well than you do.
>The head guy has worked for Microsoft for several years,
>including working on the OS (not apps).

That means nothing. I also find it hard to believe that a programmer of Microsoft operating systems is now working as a (lowly, by comparative standards) Sysadmin for a local college(?) unless he *really* screwed up his old job.

>There are just too many little things to do getting a whole lab
>full of NT set up, apparently -- at least a lab where students
>come in and abuse the computers.

Quite frankly, if they're set up properly, which any NT-familiar person can easily do, they should be next to impossible to screw up unless someone *really* knows what they're doing, or has a copy of DOSNTFS lying around.

Also, if it's set up properly, getting updates to a wide variety of machines, especially assuming it's the same update to all machines of a given class, is *trivial*.

In other words, it really sounds like your SysAdmin has no idea of what he's doing.

Maybe he's just overworked, then. Troublemakers like you don't make his job easier. Your school goes to a lot of expense to have resources like that, so you abuse them.

>There are just too many little things to do getting a whole lab full of NT set up, apparently -- at least a lab where students come in and abuse the computers.

It is about the most hostile environment I can think of. Good thing for you that I'm not your sysadmin. I'd log every damn thing you did, and the first time you started tossing off denial of service attacks, I'd have you thrown out of school. After the first couple of games you pulled, I'd pop up a message box when you logged in that said "I'm watching you". I had my network patched against the port 135 attack less than 24 hours after it was reported. I also posted a work-around to various security lists before it was patched.

>And I know you are so concerned about this, but I have had an NT user account for some time now. But I prefer to boot into DOS from my NFS boot disk... NT locks up when I try to play certain games.

This is a serious error - there is no way you should be able to boot the machine from floppy.

I'd make a special "bozo" group just for you - give you write permission nowhere, and only give you execute permission for solitaire and minesweeper.

The UK is one of the many countries where local calls are not free.
(In general. Some cable companies give free local calls, but they
exclude calls to ISPs).

He's using Demon. They do have local call access nationwide, but
these do carry a smallish charge. Demon itself is 10GBP (USD16)
per month.

My ISP also charges online time (between 1p and 1.5p per minute), in
addition to the local call charge. Believe it or not, there are reasons
why this is a Good Thing.

Actually, QuickTime (at least on the Mac) does "bang" the hardware. The lowest level of QuickTime, QuickTime components, interfaces directly with the drivers for your multimedia hardware. It is the only part of the system that attempts to control your MIDI and video capture hardware. It shares control of video and sound resources with QuickDraw (actually, the Graphics Device Manager which is a layer below Quickdraw) and the Sound Manager. I also question whether the File Manager is really an application. It does not get schedualed like an application and it shares memory with the operating system. In most microkernal designs, however, the file manager is usually implemented an a server application.

No monitor, right?

Once again, you're clueless, at least as far as what musicians are looking for in a system. A Falcon (NOT a hades) gets you near the 6400 in performance (number of audio tracks, real time effects, etc, although the Falcon's are not as cool) with the same number of audio inputs and outputs (2 ea, although the Falcon's are slighter better quality).

The Falcon also offers lower priced expansion boxes (Digital interface for under $300, Mac's over $500; 8 input/8 output boxes, around $1k on the Falcon for both, at least $2k on the Mac; ADAT interface is cheaper, not even available yet on the Mac without a Digidesign system, at least $2k; etc). The Falcon also offers demonstratably better MIDI timing which is why many musicians are still using Ataris (built-in MIDI), and the Falcon features a Motorola DSP chip built in.. again, if you want DSP chips on the Mac, buy a DIGIDESIGN board..

Now, where the Performa might shine is in real time effects (still yet to have all the problems ironed out like delay, etc, but a great idea) and a prettier user interface (color, etc.). The Performa also has a wider variety of applications written for it, and is faster overall (the processor speed makes up somewhat for the lack of DSP).

I will say I've had far more crashes on my Pro Tools III system at work then on my Falcon at home..

Price? If you could find one used, you're probably looking at $1200 or so for the Performa (with monitor) where a Falcon used is more like $500 (complete).

> You know what the Hades cost..

Just to clue you in again, musicians in general aren't all that interested in the Hades because it doesn't have an onboard DSP chip so Falcon specific apps won't run (like Cubase Audio).

So, to conclude, you don't know what musicians are looking for in an app. Cubase Audio VST/Mac is very promising, but until someone releases affordable expansion options for multiple inputs and outputs, ADAT, etc (Yes, Korg has announced a PCI card that would work at $1200, but they still haven't shipped a single one), the Falcon remains a very viable and more affordable option for MIDI and digital audio production. Look in the January '97 issue of Sound on Sound where the Falcon's capabilities are discussed in conjunction with a review of Korg's new digital mixing board.

Several years ago, when the Falcon was first introduced. I read about it in some computer mag. I was really interested in getting one! But never once did I see one or hear of a store that sold them. I guess they were mostly sold in Europe from what I hear. But it seems like there must be someplace in the US where I could get one. I'm still really interested in getting one...so does anyone have any ideas of places that sell them? Web sites or something?

Thanks!

And you have benchmarked this? Whats your deffinition of near 6400
performance? Do you know what a 6400 is?

The Falcons are stuck with antiquated 030 processor that needs a DSP.. All
this audio inputs and outputs can be added to the 6400 and still be cheaper..

> The Falcon also offers lower priced expansion boxes (Digital interface

Source please.. The reason the 6400 does not have a dsp is due to the risc
PowerPC.

And you have evidense that the Falcon has better timing? What if the musician
wants to do other tasks besides midi like web page creation, and having the best
internt tools?

Thats the deal with PowerPC..Why saddle it with DSP hardware when the hardware
changes constantly. By April, 300mhz will be mainstream..
>
> I will say I've had far more crashes on my Pro Tools III system

PowerTools III system? Must be a Mac clone firm. I would check with your
extensions to make sure none are conflicting. That should solve your crashing
issue..
>

Now were talking about used.. So what happens when you need work? Toad is not exactly cheap..

Heck I can get new refurbished PowerMac Performas 6116 for $599 with a 90 day Apple warranty. Price includes keyboard and CDROM(option and extra cost for Falcon).

The Midi market has standarized on Mac/PC. I hardly see any mention of the Falcon as a midi station.

I bet that Cubase Audio VST/Mac system out sells a Cubase Falcon one. So your asertion is that Falcon will remain viable due to cheaper expansion options? Do you have proof?

>And you have benchmarked this?  Whats your deffinition of near 6400
>performance?  Do you know what a 6400 is?
```

It's a performa with a 603e, at 180/200 mhz in a mini tower and all
the usual Mac stuff. You know what a Falcon is?

```
>The Falcons are stuck with antiquated 030 processor that needs a DSP.
```

Imagine that! Using a digital signal processor to process digital signals instead of a general purpouse chip, poor Falcon owners!

>All
>this audio inputs and outputs can be added to the 6400 and still be cheaper..

Go on then, cost it all up at general street prices and we'll se who
comes out on top.

>> The Falcon also offers lower priced expansion boxes (Digital interface
>> for
>> under $300, Mac's over $500; 8 input/8 output boxes, around $1k on the

>
>And you have evidense that the Falcon has better timing?

It's common knowledge, the Midi ports on the atari are are clocked at
the right serial speed, macs aren't.

>What if the musician
>wants to do other tasks besides midi like web page creation, and having the best
>internt tools?

If it is to the detriment of their music then I'm sure they would use
what is available on the Falcon.

>>

>
>Thats the deal with PowerPC..Why saddle it with DSP hardware when the hardware
>changes constantly. By April, 300mhz will be mainstream..

I really don't think you know what a DSP is, it's a custom chip
designed to handle digital conversion, a general purpouse chip is not
better than a dedicated chip, understand it for once.

>> I will say I've had far more crashes on my Pro Tools III system

So I thought 300mhz will be standard soon, obviously out of date trash
by then.

>>> You know what the Hades cost..
>>

I to spent over two years defending Atari and that low life Jack Tramiel. As all the mags started to disappear - and all the stores stopped supporting the ST - and all the software started to disappear - and all (or what there was of it) support from Atari disappeared, I faced the reality. THERE IS NO MORE ATARI. Please believe me, I was one of the strong Atari defenders out there - arguing day & night for therm.

But they never argued for me.... so.... a Mac or Windows? Doesn't
really matter what I'm now using, but I'll tell ya something..... I'm
happier.....

So long Jack.... you piece of garbage..... you stiff...... you
creep...... you third rate hacker..... you.... you..... you.....

ahhhhhhh...... that felt good..... Now..... back to work on my system
that has what I need.... and more.....

Cliff

I think that you would find it difficult to find operations that the DSP
chip found in the Falcon can perform faster than a PowerPC processor.

There is more to the Falcons audio matrix architecture than
what you imply, and I think you know that. Digital recording
is built into the Falcon. That is why it performs as well or
better than PPC's directed towards the same market for a lot
less cash. In the end, the PPC will cost more to outfit with
no obvious advantage over a Falcon for the purpose of digital
recording except that Cubase Audio is in color:). It's also a
much more compact machine. My C-Lab case is 2.5"x11.5"x17.5"
and aside from the standard Falcon interfaces, houses a 1.03gb
2.5" IDE drive, a 3.5" 1.6gb SCSI drive and an IDE EZ135.
The machine has over 46mb of RAM and is quite responsive.
Pretty easy to carry over to the local noise shop. Add a
Bit-Bopper setup and it's ready for nightclubs (Monitor
not necessarly needed).

That wasn't the point, a DSP will out perform a PPC chip Mhz for Mhz,
Pete howver seems to think that dedicated chips are a bad idea.

With the recent unfortunate news about Daron Brewood being linked with a porno racket on the Net, I have a few questions to ask concerning how the law stands. Is it illegal to download porn, keep it on your system, or upload it(from an external source) to say, your web page? I've only a few times come across pics I'd rather wouldn't have, and have deleted them from my system straight away. IMHO they weren't any worst than pics you would find in a mag, on the top shelf. Are there any other points to be aware of regarding this matter...? It was also said that Demon had been monitoring him for 2 years, are ISPs allowed to do this?

Thanks,

James

This is kind of off the subject, but health care in the U.S. is both
expensive and limited unless you are very wealthy or have very good
employee benifits. Of course the State picks up the tab for welfare
people like Sinplop. As far as money grabbing politications, the
assholes
that represent the U.S. government, or more specifically, the special
interest groups rob working people of their earnings to support insane

projects that generally do not benifit the tax payer but the special interest
group(s). The U.S is in need of a major overhaul and Clinton is not the answer.
The major problem, IMHO, is the increditable amout of people that come to the
U.S. each year on government programs, causing way to much overpopulation.
Clintons inability to cease gang activity or drug traffic. The crime is so
bad in citys like Los Angles that movies like Escape from LA are a Disney
story in compairson. Massive contrabutions to hostile forign nations continues
only to have them turn face the following year. The New World
Order is a bunch of shit and is doing nothing but to cause substandard living
conditions in the U.S.

First and best example is the Desert Protection Act in California.
Sierra Club "Hike to Hell", the Phantom Duck.

In article <5cdt3e$dmq@ornews.intel.com>, Rich Tietjens wrote:
: Your spamming costs me money. Notice my email address on this post; I pay
: for my Internet access, and for my entire domain's access. Therefore, your
: spamming IS my business.

This assumes that Peter is spamming.

You see, while definitions of spamming vary, I don't think that any reasonable definition includes two _crossposted_ groups as "spamming". I can see two multiposted groups being construed as spamming, but crossposting takes nearly no additional bandwidth. The gain is so small that you could save more by eliminating the single sentence I wrote above.

Crossposting is simply addition of a single newsgroup to the header. It costs nearly no bandwidth. Multiposting is something else entirely: the posting of an identical or near-identical message multiple times. It sucks tremendous amounts of bandwidth. Peter's posts are crossposted, and, unless I'm mistaken, he hasn't multiposted at all (If he has, I'd like to be able to verify that).

And if you really want to save bandwidth, go to http://www.rahul.net/dhesi/nojunk.txt and start dropping packets coming from the major spam sites listed there. It's far more effective than complaining about a few extra bytes in the header.

: Your sysadmin has basically said he doesn't give a shit - but if this
: continues, I'll ask Chris Lewis to get involved, and then your
: sysadmin WILL learn to give a shit, becasue Chris Lewis is capable of
: convincing all other admins (or a significant percentage of them) to UDP
: the uni.edu domain for spamming.

Who says he will? Chris Lewis (for those who don't know, he's one of the most prolific spam cancellers and an active participant in news.admin.net-abuse.*) does not, AFAICT, use the UDP lightly, and this is a very light case indeed. It takes a very loose definition of spam (IMO) to interpret Peter's actions as spamming (Out of curiosity, what is your definition of spam? I use a Briedbart Index of >20; it would take a 400 group crosspost to do that). Now if you want, you can drop packets that come from uni.edu, that are intended for uni.edu, or that mention uni.edu. It's probably not a good idea, but you won't ever see Peter again.

: That would be greatly inconvenient to the University adminstration and
: students. Eventually, the source would be traced to you and your
: buddy in whatever uni.edu calls the information technology department.

Again, _IF_ this happens. And I'm quite sure it won't. Chris Lewis is a reasonable and intelligent person. You have apparently become so angry at Peter due to his idiotic fanaticism that you are willing to take extreme measures to make sure that no one ever hears from him again. While I'm not saying that it's good that he's still here, I do think that you've gone quite a bit overboard in this case, and I would suggest that next time you see a post of his, you stop, get up, walk around, wait until you calm down, come back to the computer, and quietly go on.

A 56001 DSP probably does not outperform a 603e in any sense.

Dedicated processors aren't bad. However, whether they are appropriate depends on many different variables.

Right now, DSPs for audio processing are sort of useless, because you can get sufficient FP performance from modern CPUs that you don't need a DSP. In the Falcon, a DSP is required, because if you didn't have one real-time effects would be impossible.

On the other hand, dedicated hardware for 3D rendering is currently a hot item. Sooner or later, the main CPU may get fast enough that we can lose the hardware, but right now you cannot get excellent 3D performance without some form of acceleration.

I think that dedicated chips are only a good idea if the main CPU cannot
reasonably handle the load and the user wants that functionality. If you
buy a modern general purpose chip then you don't need a DSP and a
general microprocessor is more versatile. As another post mentioned, however,
3D rendering cannot be reasonably handled by a general micropressor and
a lot of users want fast 3D rendering.

The civill libertarian in me gets quite annoyed at all the hue & cry. Here in Canada a fellow was busted for possession of porn (apparently he was into 13 year old males) when the cops raided his hard drive and found the images he downloaded. He was using a text-based LYNX/PINE/TIN server via a freeNet. He would therefore have had to downlosd the files and view them off-line.

Had he been surfing with a pentium or whatever, presumably he might have been able to indulge in his kink by just browsing the images online. The legal complications occur when you download the images and save them.

Last night on the CBS news it was reported that Apple will lay-off as much as one-quater of it's work force as soon as tomorrow.
Not that I hate Mac's, but my crystal ball seems to see more than SinClaps wet dreams.

Now what would be nice, in this newsgroup at least, if most were design people. The could take a walk down to JTS, offer to work at a slightly reduced wage, and go to work with the basement remains of the Falcon. Perhaps intergrating the RISC processor onto a TOS motherboard:). (Just a joke, they will probably make more on unemployment).

In all seriousness, it will be a sad day when all you can purchase boot's up to say Microsloth on the screen:(.

Go Hades, Go Afterburner, Go Mac Clones.

Do yourself a favor, tell a friend about
YOUR machine and software and keep them
out of the PC shops. A loosing battle,
I know, but at least i'll die knowing
i've saved a few:)

I wasn't surprised. Apple's workforce has burgeoned over the past three years. They're returning to $8 billion days' employment.

> Now what would be nice, in this newsgroup at
> least, if most were design people.

I would guess that most are Newton people. Remember, Apple's PowerMac and PowerBook lines are profitable. The Performa is usually profitable as well (this Christmas being the exception, a BIG one). Monitors/printers and other peripherals are also money-makers. What Apple is likely doing is shutting down much of the unfocused and unprofitable R&D. They are likely selling Newton entirely. Remember, if Apple had no R&D budget, they would have made money last year. I suspect that Apple knows this, is ending its "be-all" status, and retreating to developments close to its product line.

The could

JTS is in huge financial trouble already. The cash infusion from Atari saved the firm from death, but they got all that wonderful debt along with the carcass of Atari. If I had $2 million, I would buy TOS and the Falcon, start up my own company (Falcon Technologies?), and license a PowerPC version of TOS to the masses. Get a viable clone base going.

PowerTOS wouldn't be hard to make - just take the phase 5 approach by including an 030 along with the PPC chip for backward compatibility, add some kickin' APIs for video and audio. TOS already has the preemptive multitasking and multithreading needed, as well as memory protection.

> In all seriousness, it will be a sad day when
> all you can purchase boot's up to say
> Microsloth on the screen:(.

I wouldn't despair. At the very worst, Apple will simply retreat to its core markets and live there. It works for Sun. And C-LAB will keep making Falcons.

> Go Hades, Go Afterburner, Go Mac Clones.

Mac clones are doing quite well. Something that may interest you - overall Macintosh market share (including clones) didn't change last year. The media is slamming Apple's drop in sales, but that drop came about primarily because Power Computing and UMAX were undercutting Apple's prices in the low end. I am not predicting the end of the world.

> Do yourself a favor, tell a friend about

Every time I tell them about Falcon or Mac, someone like JEDI comes in and dictates how superior and seamless life with 70's-era hardware and software is. And they go for Windows 95. We users have to learn that a frontal assault isn't the way to go. We need to build up supremacy in a number of niches, grow our companies to large size, and then declare war. Again, look at Sun Microsystems. Not hurting at all, but hardly an ubiquitous model of machine.

> Let's Kick Intels Ass :)
>
> Mike

I wish. . . I suspect Intel is even tiring of Microsoft. Fear not, a sea change is in the air. Other hardware makers besides Apple are hurting. Their anger with MS licensing, etc. will seal MS's fate. But it will take some time.

Even though I own one of those Intels, I love the Mac I have and the
1040 ST that I have. Where else can you run an operating system with 4
megs of ram. You would never be able to do that on MS Windows NT 4.0
Workstation on a PC

Don't be such an idiot. I work on Macs daily, including said 6400.

On the other hand, just how much experience do you have with the
Falcon? Have you ever edited digital audio on one?

Also, I'm talking about OVERALL audio performance, not just processor
speed.

> The Falcons are stuck with antiquated 030 processor that needs a DSP.. All
> this audio inputs and outputs can be added to the 6400 and still be cheaper..

See, you have NO CLUE what the FUCK you are talking about. I am a
Professional audio editor and musician with over a decade of experience
in digital audio. You know nothing about the subject. Pro Tools
Project is the least expensive currently available Mac system that
offers 8 outputs and 8 inputs. It is around $3k, NOT including the
computer. The Korg card, which offers only 2 inputs and 2 outputs (but
is expandeable to 8 inputs and 8 outputs for another $1500) is $1200
itself. That's all there is out there, moron. I will assume you have
spend a little time in math class, so I'll let you do the math yourself.

> Source please.. The reason the 6400 does not have a dsp is due to the risc
> PowerPC.

Which I alluded to, but you cannot use effects that were written for a
DSP chip (like all DIGIDESIGN effects) on the PPC without a Digidesign
card. Yes, some are being re-written, but they haven't been yet.

> And you have evidense that the Falcon has better timing? What if the musician
> wants to do other tasks besides midi like web page creation, and having the best
> internt tools?

Yes, I do. There have been a couple of articles written in european
music magazines that deal with this question. Try searching the
archives of Sound On Sound if you really want to know.. and I trust you
don't.

Also, because of the way the Mac handles digital audio via its inputs,
there is a slight audio delay when recording new audio while listening

to previously recorded audio, especially when VST's real time effects are used. It's not a huge delay, but it's something to be aware about.. if you're recording timing critical audio, it might interfere with your groove.

Nice try attempting to change the subject. The issue is AUDIO tools, not WEB tools or word processing.

> > I will say I've had far more crashes on my Pro Tools III system at work then on my Falcon at home..
>
> PowerTools III system? Must be a Mac clone firm. I would check with your extensions to make sure none are conflicting. That should solve your crashing issue..

Now, you've demonstrated your complete IGNORANCE of the audio world. Pro Tools III is a Mac based digital editing system.. THE MOST COMMON ONE IN THE WORLD. If you don't know what THAT is, then just shut up about audio on the Mac. You're clearly talking out of your ass.

> Heck I can get new refurbished PowerMac Performas 6116 for $599 with a 90 day Apple warranty. Price includes keyboard and CDROM(option and extra cost for Falcon).

Sure.. you could. But the same audio input/output issues apply. If you're buying it for audio, who gives a damn about CD-ROM?

> The Midi market has standarized on Mac/PC. I hardly see any mention of the Falcon as a midi station.

And you've already demonstrated your ignorance of the market by not even knowing what a Pro Tools system is. Truthfully though, the Falcon is not very popular compared to Mac/PC. But I'm not buying a computer based on a popularity contest, it's how well the computer does what I want it to do. It does, for less money.

> I bet that Cubase Audio VST/Mac system out sells a Cubase Falcon one. So your asertion is that Falcon will remain viable due to cheaper expansion options? Do you have proof?

Yes, Cubase Audio VST clearly outsells a Cubase Falcon.. it seems like a system with excellent potential. I'm making music NOW, not waiting for potential.

It eventually will be a better bargain then a Falcon. I don't know whether the Falcon remains viable or not.. I just know it IS now, I can create without limits right now. That's all I need to know.

I already gave you proof, I gave you model numbers and prices. You gave me a bunch of hot air and demonstrations of your ignorance.

You already have a Mac, you know little about the Falcon, and even LESS about digital audio production. Tell you what.. I won't speak out as an expert the Mac computer if you won't speak out on ANYTHING that has ANYTHING to do with digital audio production ON ANY FUCKING PLATFORM.

-Mark

Laws regarding depictions of the naked human form vary from place to place, James. In parts of the US, it's illegal to sell Playboy. In other parts, it's illegal NOT to sell it (censorship being cited). I suppose the UK has its own share of wierd laws regarding sex and images of it.

In the US, they are allowed to do it BUT if they reveal any information so garnered to a third party (including law enforcement officials) without a court order, they are violating a great number of laws. Again, the UK has its own strange rules. I don't know what they are, but odds are good that they are unique to your island nation.

Very true, as that would be classed as 'possession' rather than a quick
peek. Having said that, if he was using a browser like Netscape and
they'd checked his cache folder...

AFAIK, it's illegal under the Obscene Publications Act in the UK to have
any pornographic material in your possession, no matter how it's stored.
The illegality obviously doesn't include topless or nude photos, and
begins with anything depicting the sexual act.

> have deleted them from my system straight away. IMHO they weren't any

If you're talking about the sort of nudes you see in mags like Playboy
or lower-end junk like Razzle, then you should be OK.

> any other points to be aware of regarding this matter...? It was also
> said that Demon had been monitoring him for 2 years, are ISPs allowed

I'd take that with a pinch of salt. Demon have always made a stand
against Internet censorship, and I doubt they would do so without a High
Court order. I also can't believe that the UK Police would monitor an
individual's internet access for such a long period of time, either.

>including an 030 along with the PPC chip for backward compatibility,

Why? A PowerPC is fast enough to emulate the 030 much faster than a real
030. Even with Apple's original 68K emulator on the 6100/60 (60 MHz, no
L2 cache), users saw emulation speed that was faster than a Mac IIfx (40
MHz 030). With a dynamic recompilation emulator, I have observed
emulation speed twice as fast as a 40 MHz 040 on a 100 MHz 601. Adding a
second CPU that uses a different memory bus protocol adds a lot of
complexity (and therefore cost) to the machine.

Fast emulators eat lots of memory (Apple's original emulator has a 512K
dispatch table in ROM, and DR emulators use several hundred KB for
translated code caches), but these days memory is cheap.

> add
>some kickin' APIs for video and audio. TOS already has the preemptive
>multitasking and multithreading needed, as well as memory protection.

Atari enthusiasts interested in a lightweight OS that supports all sorts
of neat stuff without incurring overhead should really look at BeOS. It's
much better than TOS, easier to write programs for, etc. Be is no longer
going to produce the BeBox; instead they are going to target PPCP and
Macs. But you can get nice Power Computing machines for cheap, and
PowerComputing is going to start bundling BeOS as well as MacOS with their
machines.

Somebody should write an Atari ST emulator for BeOS. (Actually, I'd like
to see one on MacOS too. MagiCMac is nice, but it really isn't that
compatible.)

If Apple and Be hold to their current promises for OS development, within
a year I will finally have a system I'm really happy with: a fast
non-Intel processor with a real OS, and a second OS to hack with.

I personally don't think so, who made this up, err I mean where did you
hear that little rumour then?

If the police ask an ISP to hand over 'evidence' of some kind then I
think they would have to.

Rich, where in the U.S is it that I can not purchase Playboy? I sure as hell don't want to move there:). This censorship thing is getting to be a big problem in the U.S, and i'm not just talking about Playboy stuff. On the news last night, the lady incharge of the French language usage in France, implied that the University of Georgia because of their 80% English pages would be banned from the French domains. Hey, it dosen't bother me one way or the other about the language thing, if it's TOS i'll figure it out:). How did Clinton get elected again? What the hell is wrong with the American Public? Was it the illegal aliens that voted for him after he granted them amnisty with my tax dollar? You know I can get pretty wound up when someone says something bad about a Falcon, but when someone starts sticking up for the political offficals that are running the U.S into the ground and distroying all the natural resources I really get pissed. I know this dosen't belong here but I wasn't the one who started the UK-US healthcare shit in the NG. I better stop before I go call some 800 government numbers to relive my inner fustrations.

Remember, one if by land, two if by sea. This definetely looks like it's comming by land.

>A 56001 DSP probably does not outperform a 603e in any sense.

I must confess I don't have any hard fast facts about this but the DSP
doesn't run particularly fast. How fast would a 603e need to be to do
CD Quality audio?

>Dedicated processors aren't bad. However, whether they are appropriate
>depends on many different variables.

>Right now, DSPs for audio processing are sort of useless, because you can
>get sufficient FP performance from modern CPUs that you don't need a DSP.
>In the Falcon, a DSP is required, because if you didn't have one real-time
>effects would be impossible.

Not impossible but of a much lower quality, my Atari ST with nothing
but a 68000 cpu does realtime effects on 8-bit audio at upto 30khz.
CD quality is about 3x the data.

>On the other hand, dedicated hardware for 3D rendering is currently a hot
>item. Sooner or later, the main CPU may get fast enough that we can lose
>the hardware, but right now you cannot get excellent 3D performance
>without some form of acceleration.

Ok then fair enough, maybe for simply sampling audio it's not much use
but as far as things like games are concerned, using the DSP to do
visual and audio effects leaves a lot left for the main CPU and a
similar thing with multitasking.

And just a final note, i'd like to re0iterate what I said when I first
began posting here (as I guess many here have joined since). I quite
like macs, they're pleasnat machines and they can do some things that
Ataris can't. But Atari made some superb machines which are
under-rated and highly capable with a bit of fine-tuning. I'm more an
arguer against the crap arguments Peter puts straight forward than the
Mac itself. So there you have it :)

>Chris Heiden
>.

Chris,

The 5L works brilliantly with the atari computers. Use the HP L4 driver in NVDI4 gives you 600 or 300 dpi printouts On the TT with outburst prints a page in 20 seconds In magic use the new print prg in the auto app folder and printing is even faster than outburst.

You will have to edit the print driver to remove the page commands in the L4 driver using the print driver edit program that comes with NVDI this will fix the auto page feed problem with the 600 dpi driver.
Regards

Last week IBM and Motorolla announced that they were dropping WinNT development and support for PPC but will continue to offer and support it on Intel. CHRP's promise was any OS on one machine, now it is just MacOS and BeOS...

The NeXT merger was greeted with mixed review as well. One of the largest stumbling blocks ahead is that Apple has no definate plans for their next OS and developers are dropping out of the Mac platform daily.

All of this news can be found in Reseller News. the pulse of the Computing market and Industry.

All the best,
Chris @ Computer Direct

I'm am sorry to Daron and anyone else I might have offended in my
original post, for the record he has not been linked with a porno
racket on the net. It was very bad wording, and I hope I've not
offended anyone. All I wanted was to ask the questions...

James

This is probably not something I should butt into, but Rich says something that is simply not correct, during the process of flaming Peter Sinclair-Day for "spamming" comp.sys.atari.st:

In article <5cdt3e$dmq@ornews.intel.com>,
postmaster@atarinet.portland.or.NO.SPAM.us (Rich Tietjens) wrote:

>I will explain this in small words, so that the other janitors at University
>of Northern Iowa can translate it to whatever dialect of simian ASL you
>understand.
>
>Your spamming costs me money.

No, it does not.

When a news message is crossposted to several groups via the Newsgroups: line, only one copy of the post is sent. The various news handling software packages, so far as I am aware, are smart enough to not require duplication at any point. It is therefore untrue to complain that crossposts into comp.sys.atari.st cost you money. The most it costs you is visual clutter in the newsgroup, which would be a valid complaint. Most people address it with killfiles (which in the long run would be the best way to get rid of Peter, or me if you happen to harbor a dislike for my scribblings).

Your conception of what entails spamming seems to be rather different from most other people's, by the way. Having a few too many newsgroups included in the header is different from intentionally trying to shove your message into every group possible.

I personally feel that the threat of cutting Peter's entire uni.edu domain off was excessive, rude, and an obvious attempt at bullying him into submission. Peter is annoying, but he is incredibly well-behaved compared to the sort of people who have gotten entire domains nuked in the past. Only an extremely objectionable act can justify cutting off thousands of users just to get at one offender and an uncaring sysadmin.

I could of sworn that there were several librarys available to TOS and
MagiC programmers that deal with 3D interface. Take a look in the Falcon
archives on CNAM. Face Value is kind of nice to.

I have Video Master Falcon, and for a while had the Expose card from Titan. The Expose is quite the performer, I just wish I could get an NTSC version. On my Quadra 900 I have an old Radius Spigot. On a good night I can capture about 17fps at 240*180 but the Quadra is so damn slow at editing. I usually save out the frames as .TGA's and load them into Apex Media on the Falcon for a more user friendly enviroment and faster processing. The Radius has ok quality, but falls a little short to what I was getting with the Expose card. At work I have a Quadra 840 AV with a video compression card by Radius. It will capture 640*480 at 30fps but the quality is crap, and because of limitations with the Mac you can only view your work in 16bit color depth while working with the input or raw file.
I checked out the price to upgrade an Amiga to one of the Towers your talking about. Not cheap:). I'll look around the local recycler (www.recycler.com) for a good price on a 2000.

Sorry about pulling the ab.jpg file. It didn't seem that there was much interest in the test at the time.

I was looking through the Apple Tech Lib and saw a some bits
about a few MIDI apps where the programmer didn't seem to want
to use the perfered method by Apple to access the serial port.
That is what "Serial Switch" is for isn't it? I kind of though
they probably programmed it that way for improved throuput during
playback.

I first noticed this when using Sparkle. It was after reading the
docs that I became aware of the "bug". I do use QT 2.5 so I guess
it's still there.

I didn't try loading it on the Falcon with the CPU doing
the work. The time would probably be close to what your
getting on the Amiga.

> If someone hasn't gotten the picture, I've put it up at

Hopefully Frank or Magnus read this and try the file
on their Afterburner Falcon 040's. THAT would be
interesting:).

The 50MHz 040 I have has 128K CPU cache and the card plugs into the PGA
socket. I removed the card as the PDS slot (where the DOS card is
installed)
does not function with the 50MHz 040 card (at least the DOS card dosen't
work). DiiMo no longer exist but the same card is available under a
different
name by MicroMac.

Sig deleted by request:)

I thought that "Serial Switch" was meant to fix problems when a program tries to execlusively control the serial port. Anyway, the point is the same.

: >That's really a driver-level task.(or shared library)

: See below.

: >: Does TOS have anything like QuickTime?
: >
: >Isn't QuickTime a thing like PC's AVI files?

: No. AVI is just a simple movie format. QT is a generalized format for
: data played over time (QT tracks can contain all sorts of different
: things). QT is also a complete set of operating system calls to manage QT
: data, so that if you are a programmer, you don't have to worry about the
: details of it yourself.

Once again,this could be implemented as a shared library or server process.
(you might have to add simple rudimentry functions to the graphics driver
like the ability to allocate and find the graphics memory buffer)

: >I don't see what animation has to do with OSes.Do you know what TOS is?

: Yes. I owned a TOS computer for several years.

: In this day and age, a personal computer operating system is expected to
: provide a wide array of services above and beyond the basics (memory
: allocation, process management, file systems, and basic I/O).

But what you've described (handling data) is the job for a shared library.
MacOS should already have the capability to handle graphics and sound.
(or it's drivers would,to be more acurate)

Many microkernel operating systems implement the *file system* as a user
mode process. Does this mean that the file system is no longer part of
the OS, just because it doesn't execute in the kernel address space or
supervisor mode?

QT is in fact a set of shared libraries. Nonetheless, it is a service
offered by the Mac OS to application programs. The main reason QT is
implemented that way is so that it doesn't needlessly occupy memory while
it isn't being used.

>: BTW, next time you reply to something, please trim the parts of the post

>How would I delete more than a single line with PICO!?!
>(PINE's editor)

I really haven't the faintest clue. PICO is nice and easy to use, but it
seems to be deficient in capabilities. Not that I'm a wizard with UNIX
text editors; I refuse to learn vi unless I really have to and I know just
enough EMACS to get by.

:
: I have Video Master Falcon, and for a while had the
: Expose card from Titan. The Expose is quite the performer,

I haven't heard of expose, but I know of the Videomaster, which is also
available for A500 and A1200, though it does not seem much cop, if I have
understood you requirements right.

: I just wish I could get an NTSC version. On my Quadra 900
: I have an old Radius Spigot. On a good night I can capture
: about 17fps at 240*180 but the Quadra is so damn slow at
: editing. I usually save out the frames as .TGA's and load
: them into Apex Media on the Falcon for a more user friendly
: enviroment and faster processing. The Radius has ok quality,
: but falls a little short to what I was getting with the
: Expose card. At work I have a Quadra 840 AV with a video
: compression card by Radius. It will capture 640*480 at 30fps
: but the quality is crap, and because of limitations with
: the Mac you can only view your work in 16bit color depth
: while working with the input or raw file.
: I checked out the price to upgrade an Amiga to one of
: the Towers your talking about. Not cheap:). I'll look
: around the local recycler (www.recycler.com) for a good
: price on a 2000.

Well, the 2000 seems a good choice if you are willing to upgrade it. There
is the A2060 060 accelerator for the A2000 from Phase5, and it has slots
to contain anything you can point a stick at.
The video ports of the Macs something I am very impressed with, however.
Definitely an advantage over the PC for Macs. The PPC Macs are quite nice
machines, but it's ridiculous that one needs a 100 MHz+ RISC processor
just to have an acceptably fast environment, but now I can see the letters
on screen as I type. =)

: Sorry about pulling the ab.jpg file. It didn't seem that
: there was much interest in the test at the time.

I have it up at http://www.canit.se/~optimus/pix/ in case anyone wants it.
Hope you don't mind.

And the Mac was a follow-up to the Lisa. As I recall, the ST shipped before the Amiga, making it the first color 68000-based machine. The 1040ST was also the first 1MB computer to retail for under $1,000.

I don't really think you can say any 1 computer was truly first. Many computers--back in the days when choice was an option in computing--qualify as first in one area or another.

Mission critical application. Atari ST. Intersection is the null set.

If you have a real mission critical application, you don't buy an Atari
(mine for instance needed to be bent back and forth a few times every
month or so to keep it working, or the pins would touch the RF shield and
short out).

The IIx was the first 030 model actually, and there are many reasons,
the main one being that they ran what was essentially the same OS as all
the rest of the machines.

hi,

I am in search of these games that you have in your closet, up in the attic or under the leg of an uneven table. Get some cash for those games that you don't play anymore. Sell them to me. If you have any of the titles below I will buy them. They have to be in working order of course and for the Atari ST. Thanks! Waiting to hear from you. Contact me at mykle@con2.com

Adams Family
Super Cauldron
Prince of Persia
Leander
Lemmings
Pirates
James Pond II

Fire and Ice
Underworld
Cadaver
Chaos Engine
Knightmare
Captive
Gods

Nice try Rich...

I am sure that you violated the internet code of conduct for impersonating ones internet address..

Maybe I should talk to your friend that you use to cry on his shoulders when you can't have control of the usenet. You act like some of the ITS folks..

Forgive me--make that the first widely publicized/marketed (temporarily, anyway) 68K machine with color in the U.S.

(By that statement I refer to attention being paid by, say, COMPUTE!, BYTE, and Family Computing.)

: It is implemented as a shared library.

Then it's application level,since it's part of the process's code section.
(and and data and bss)
At least from a UNIX point of view.I didn't think they had libraries on
the Mac.(unless you're counting the "resources")

: >How would I delete more than a single line with PICO!?!
: >(PINE's editor)

: Change the editor to vi.

How do I do that from Tin 1.2 PL2?

I always wondered why sysops never wanted you to have access to vi.
I assumed it was because they didn't want you shelling to DOS,but it
seemed to me that changing the "SHELL" varrible to "/bin/true" (or
whatever) would keep vi from running "sh".(or whatever)

Of course I don't know if there's anything that would keep you from
writing out the file to a different name.

You could have the BBS (or Gopher,in my case) run vi as a user-id that has
no meaningful access,but with the same group-id as the edit-file.
(which would have the user-id of the BBS)
Then,even if you could hack your way to a shell,it would be pretty damn
useless.

Hello, I am a newbie with a question concerning how to run *.com & *.atr
files using xlit016 and xf25 Atari emulators. Can you explain what is the
difference and between these extension and please explain (in some detail
as I am a newbie) how to run these files? Thanks. If you do not have time,
could please forward this message to a newsgroups that might be
appropriate?

Tracy

As I pointed out before, many microkernel operating systems (including
microkernel variants of UNIX) implement their file system as a user
process. By all reasonable definitions, the file system is part of the
operating system. The address space and CPU mode a piece of code run in
do not determine whether it is part of the OS or not.

Thanks. I'd forgotten about that one. Looked like a Mac II, and later the IIfx had the same case IIRC.

[Lots more snipped]

What I would love is for someone out there with the brains for it to pick up what's left of Commodore and Atari Corp. and put what was the best of them together and go from there.

Both of these companies have a lot in common. Both of them had some good ideas ahead of thier time that could have really taken off, but human nature being what it is, intervened and they fumbled, allowing the likes of Microsoft, IBM and Apple to pick it up and run with it.

Commodore's biggest success was the Amiga. It should have prospered for years to come, but only snatched defeat from the jaws of financial victory. The same holds true for Atari. They could have been a winner with their ST line of computers, the Falcon and the Jaguar game machine, but instead they filed for bankruptcy.

I guess I'm just a little naive, as I type this into my Amiga 2000 late in the Los Angeles morning, with a dead Commodore 64 and Atari 2600 taking up space, and lots of old Atari VCS and 7800 games about. Isn't there anyone out there with enough foresight and imagination? Someone who sees these innovations for what they are, and what can be done with them? Hardly anything from either Atari or Commodore ever completely realised its true potential. I guess what I'm saying is we could really use a white knight about now.

I'm not going to hold my breath, though.

It's been a while, so forgive me, but isn't MiNT something you install on *your* machine? IE, it doesn't protect other people.

> That was probably just your machine.

Actually it was a well known flaw, so well known that Atari magazines of the day referred to it as the "Atari twist" and various success stories about it's efficacy appeared time and time again in the letters to the editor section (some of them rather dubious of course).

The problem with it was that doing it more than a few times would slowly work the ROM's out of their sockets, resulting in the eventual unbootability of the machine. At this point you'd have to take it apart and reseat them by hand.

And more to the point they were just plain junky. Cheap moldings for little strength (my mom dropped my old II down the stairs, it worked as soon as she got someone to plug in the video card again), tin foil RF shields, and the worst keyboards I ever used on any machine.

Not that there's anything wrong with that, they were selling into the C64 market after all, but that keyboard was unforgivable (notably when you use a Mega, which had a very good one)

> Thanks. I'd forgotten about that one. Looked like a Mac II, and later the

Correct. What a lemon that one was!

Quite right although I don't recall Rich posting to just the advocacy
groups of late but seeing as there is just one major cross-posted
thread there, this is not surprising.

>
>Your conception of what entails spamming seems to be rather different from

Yeah, the meaning of Spam is regularly being widened to include many
things. This falls under the "off topic crap" banner.

>I personally feel that the threat of cutting Peter's entire uni.edu domain
>off was excessive, rude, and an obvious attempt at bullying him into
>submission.

Also a threat I would think was as idle as very idle thing. Not
through lack of trying, I'm sure Rich would do his best to cut off the
domain but I somehow doubt off topic postings to a single group (and
not entirely off topic) warrants the cutting off of an entire
university! I don't know anything about this person you know (Chris
Lowe?) but if he has these sort of powers then I really hope he isn't
the pedantic fuckwit you imply him to be and I'm quite confident that
he isn't.

>Peter is annoying, but he is incredibly well-behaved compared

I would like to make it qite clear that this does belong in the
advocacy groups and this is the only posting of many on this thread
that I have also cross-posted to the general group so appologies for
this being off topic.

I assume that you use Oasis with NOS? I don't know if it works with

anything else so I'll assume you do. If you ftp to:
ftp.demon.co.uk/pub/atari/ka9q
There is another directory in there (I dont recall the name, but it implies it was written by someone else). In there you shall find NOS_POP3.ZIP, this version of NOS is exactly the same as 0.42 which you probably already have but: It also has support for POP3 email and the killfile bug has been fixed. Look around for a NOSFILES.LZH and this will give you instructions on how the killfiles work, it should be in the ka9q directory. If you need help then give me a mail. And you can also bounce his emails if you like, you can just put his email address into a file called MAILKILL in the Oasis directory and when Demon tells you you have a message from him Demon will kindly "return to sender".

Well sports fans, it's time to start a new thread here.

I just picked up the March issue of Mac User(Cover: Whats Next).

Had a review with screen shot and rating of the Steinberg Cubase 3.0 VST. Recieved a four mouse rating out of five. Now that the PowerMac line has had a premiere midi app, does the TOS platform matter considering the high price of the hardware.

$1800 Buys a fast Performa 6400/200 with 2.4 gigs, 256 k cache, 16 megs ram, keyboard, 28k modem, internal subwoofer, Surround sound(SRS) and software bundle.

You know what the Hades cost..

I've got to agree, my Atari virtually never crashes, it's a very solid
machine. I've also had it for 8 years, it's on for quite few hours
virtually every day, I crash about once a month and thats normlly when
I set up too many sessions on my internet software. In all this time
the only thing that has ever physically gone wrong with it is when the
PSU dies but that's hardly a failiure of the machine itself.

organization: World Access, Internet, E-mail and Videotex
newsgroups: comp.sys.atari.advocacy
```

Hi there, and sorry for the cross-posting...

GEMulator is an Atari ST emulator for PCs. The creation of a newsgroup is in the making, although limited to a planning stage at the moment. I am currently setting up a FAQ file, and I would like to request everyone who has fixed any of the problems he ran into to write them down (including their solutions) and mail me at my private email address. It looks like the first version of the FAQ will primarily be questions (so you're welcome to ask questions that you don't know the answers to, too), but I'm sure we'll get there in the end.
If you want to be put on the GEMulator FAQ mailing list, please email me with a subject of "sub GEMulator FAQ list".

If you want to have a look at some of the problems *I* am having with the GEMulator...

1) "ST Zip" won't work. It cannot write (deflate) anything; it gets write errors on the hard disk. Can this be fixed?

2) Can "FastCopy Pro" be made to work? I tried to copy a disk (this had readable directories and folders) and, although FCopy appeared to work fine (albeit slow when writing) the target disk had 0 bytes used, and no folders either.

3) "Revenge Doc Displayer" refuses to be installed properly. How come?

4) "Freedom" seems not to work; the file selector seems unable to let you save a document that already exists, although it does update the time stamp.

5) "Xboot" sees folders double and can't find its own "c:\XBOOT\" path. Suggestions?

6) "Ledpanel" doesn't work.

7) I tried installing Geneva and Neodesk 4 on the GEMulator. Neo4 seems to work just fine. Installing Geneva goes fairly OK, but it can't use Neo4 at the same time. I think the problem is the following: To autoboot Neo4 from Geneva (as a shell), Geneva has to read the specs from GEM.CNF. And the GEM.CNF is always 0 bytes after installing it on GEMulator...

8) The GfA Basic compiler "MENU.PRG" screws up compiling. I fixed this problem...a solution will be in the FAQ.

9) A failsafe way to check the write-protect status (on any Atari, any TOS version) won't work on GEMulator. How can one check this now?

That's it...I hope there'll be lots of response.

Did the TOS Platform ever matter?
To me it did/does...because I own some...paid my good money several years ago and the freak'in thing still works...so it matters! Now...there's no contest when it comes to which machine is the best...you're wasteing your breath here comparing a 1992 release machine with a 1997 release... the Mac is the way to go if you are "just now" selecting a new computer

and have 0 to few investments in software, data files, etc. Use your brain man! Most professional minded people buy a tool, and they wear it out...and get as much life from it as possible...hence they can make more of their capital rather than constantly replaceing perfectly good tools. Eventualy, TOS owners might be foreced to move on...but till then...why throw away a couple grand (minium...not counting software replacements) when you don't really need to?

Are you saying that everyone who owns TOS based machine should get rid of it and by a Power Mac simply because it's newer? That's damn crazy! With that attitude...you'll never get ahead because you'll be spending all your profits on new computers and software every year...at least there are some people out there who understand that supporting something that people use every day matters. Now wouldn't you be pissed off if you went to get a part for your car, and no one "supported" your make of car anymore because it's over 5 years old? You paid your good money for it...and it matters!

TOS does matter as long as there are people using the machines.

:
: You know what the Hades cost..
:
Hey...what does the Hades have to do with VST?
The Hades does not support sound as it is...I don't think CuBase Audio will even run on Hades. New C-Lab Falcons are around $1,100 with 14 meg of RAM. Granted...I'd most likely choose the Mac if I were shopping today for a new Computer for Audio and could afford to shell out 1,800...but I did my shopping a few months ago, and my Falcon 030 with 14meg of RAM and CuBase Audio only set me back $700...that's a long way from $1,800! I turned around and sold my STe and a bunch of other junk for a little over $200.00...hence...$500.00 got me into digital recording. It's not that I want to be a cheap-scape...I simply don't have much choice.

The Hades isn't even designed to compete with the Power Mac...
It is simply a custom made niche machine for people who want or need something "different". No one is going to make tons of money selling Hades...but then again...not many people make tons of money playing golf either...but they do...so it MATTERS!

Brian

I had WIN-OS2 installed for awhile and it worked with most software
that wasn't tied to deep into the hardware.  I finally decided that
WIN-OS2 was just taking up space and took it off.  I still have
Windows 3.1 on a separate partition if I need it.

I found that OS/2 and linux do most of the things I'm really
interested in so Windows is just a backup or in case I need to
use Word or something.

: |
: |What would it take to interface win-32 to PM???
:
: Stupidity.

WIN-OS2 is a viable option for those that need MP in Windows 3.1.
I had a Watcom Windows compiler and if I wrote something that
crashed Windows, I just had OS/2 kill Windows (what a feeling) and
started over.

The problem is is that most ISVs that write Windows software see
WIN-OS2 as a different OS and don't test or support it. You
kind of take your chance. You still almost need regular Windows
as a backup.

I could see situations where you could be working for a company
that uses WIN-OS2 and they have a limited set of applications
that all work fine and you use only them.

If you really want win32 then get NT or 95. Your kidding
yourself that you want OS/2.

Yes, QuickTime is just another API. Like the File Manager and Quickdraw.

The high price? An ST is very cheap nowadays.

: $1800 Buys a fast Performa 6400/200 with 2.4 gigs, 256 k cache, 16 megs ram,
: keyboard, 28k modem, internal subwoofer, Surround sound(SRS) and software
: bundle.

```
But no MIDI ports?

: You know what the Hades cost..

Do studio musicians really need a HADES when they can get a Falcon MKX?

200+ pics of Sandra Bullock
150+ pics of Liv Tyler, young star
130+ pics of Niki Taylor
130+ pics of Kate Moss!!! For a list of ALL files on the CD
100+ pics of Madchen Amick
100+ pics of Racquel Darrian - *WOW*
80+ pics of hot model Jenny McCarthy! (Nudity!)
80+ pics of Paulina Poriskova, sexy supermodel!
70+ pics of Bridget Hall, supermodel!
50+ pics of TRACI LORDS, yes! ***6 Celeb CDs in One!***
50+ pics of Daisy Fuentes, hot spanish VJ
50+ pics of Salma Hayek, sexy latina actress! order now
50+ pics of Teri Hatcher 1-757-686-1271
* 4000+ pics of other NUDE stars
* 4000+ pics of PG-13 rated celebrity poses
* 10,000+ pictures total, thats TEN thousand!
* Graphics viewing software for Windows3.1/DOS/Win95
* CD is BBS ready, with descriptions of files! And its Mac readable!
* Many more features and pictures of stars!
* NO AMATURE MODELS! - ONLY Celebs!

(Orders call 757-686-1271)

Other information:
* Packed in white shipper: No signs of nudity (Wife protection plan!)
* There are over 10,000, that's TEN THOUSAND FILES, on ME#3 alone!
* All pictures are high quality at least 640x480!
* Directories are arranged in NUDE/NON NUDE format for easy use!
* Graphics viewing software for Windows/DOS/Win95
* CD Is ISO-9660 Macintosh compatible if you have a Mac JPG viewer
* It's truly BBS-ready with detailed descriptions of all files!
* ME#3 will save you -ALOT- of download/searching TIME & MONEY!
* Sysops! Has a files.bbs conversion program for different formats!
* Many more features.. Guaranteed or your money back!

This CD represents high quality work. Here is the pricing:
$$$ $36 each (plus $2 shipping, $5 shipping outside USA) $$$

(*) Call 757-686-1271 to order via credit card over the phone!

Qualifications: You must be OVER 18 & live somewhere on planet EARTH!
Please remember, Foreign orders add $5 for shipping instead of $2

Subject: Get the Atari ST/TT/Falcon "Ultimate Virus Killer" TOTALLY FREE
Date: 1997/01/22
Message-ID: <N.012297.160359.94@wxs4-15.worldaccess.nl>#1/1
X-Deja-AN: 211464704
organization: World Access, Internet, E-mail and Videotex
newsgroups: comp.sys.atari.advocacy
```

Hi to all of you!

There is reason for some celebration! Since I started doing the "Ultimate Virus Killer" commercially, in spring 1988, I have personally sold 3000 disks (this is barring the sales through people like Oregon Research, CRL and Douglas Communications, about which I have no statistics). This morning I sent off the 3000th disk, which made me pretty content.
I'd like to celebrate this with all of you, so I am now offering all of you the opportunity to become a registered user of the "Ultimate Virus Killer" *for free*, yes, you read that correctly, at no charge! This means you'll be getting the latest version, 7.0, and you will be eligible to receive updates at a drastically reduced price.
Here's how to go about it (and a few conditions):

1) Send one formatted double density disk and 2 International Reply Coupons (3 International Reply Coupons if you live outside Europe) to "UVK offer", P.O. Box 67, NL-3500 AB, Utrecht. Instead of a disk, you can also add an extra International Reply Coupon.
2) Make sure it arrives at my P.O. Box by January 31st at the latest (!).
3) Only one free copy of "UVK" per address!
4) This offer does *not* count for people who are already registered users through me direct or through Oregon Research. It *does* count for people who have registered at Douglas Communications.
5) This offer does *not* count for people who live in the USA or Canada (contact orres@teleport.com to get your copy at a regular price).
6) If in doubt, or if you have questions, simply email me and ask.

The "Ultimate Virus Killer" is the industry standard virus killer for the Atari range of computers. It works on literally *any* TOS version, any hardware configuration, any multi-tasking system and "GEMulator" (and probably on any other good ST emulator such as Magic PC, Magic Mac and STonx, though this is unconfirmed). It recognises 98 bootsector viruses and 5 link viruses, and can restore the original bootsectors of almost 800 games and megademos. In total it can recognise well over 1800 different commercial and non-commercial bootsectors (viruses, anti-viruses, games, virus free disks, bootsector demos, etc., etc.).

Hope to hear from you soon...

```

:). Try about ten times slower than that on the Falcon SCSI:).

>

The "fast" ram in my Falcon is 32bit, however to utilize video it has to
go through a "buffer" to get the info to the video (st) ram. It's a
small
card with a PGA mounted 030 and eight simm slots. Fits on the expansion
slot.
There is a newer card available now, looks the same but with an 040
sitting
there. "Blows" mine away. I wish Magnus or Frank would have tried the
"test".
The file is now removed.

I have an 840AV at work. It is a really nice machine for the price I
paid.
I think used it was $999.00. It's quite the performer with MagiC Mac and
the 40mhz CPU.

I forget now, but either Graphics Converter or DeBabelizer allows you
to choose Quicktime or not.

Yea, the hardware is bitchen. I just like the simplicity of TOS or
MagiC.

Who said anything about French? If you refer to the above mentioned
utilities, only Mac (and Win 95) users can display such ignorance about
such basic InterNet utilities.

: > They are produced in larger quantities, which explains the pricing.
:
: Ye, so..Welcome to market realities.. If the Hades were priced a $1,000, the
: true market value, volume would be up to the Atari faithful..

True.

: > Tell me, what is a "3D appearance manager"?
:
: Allows the user to totally design their desktop based on their ego, style and
: creativity.

Sounds nice.

: The 3D appearance manager is exactly what it states..

It works in 3D? What type? Polygon, wireframe, phong, gourad, trace,
scanline? Has it got B-splines?

: > Well, they haven't proved much good taste in naming their systems yet,
: > aside from Tempus.
:
: Tempo..

First they name it after an astronomer, then a parking lot, and now a
warehouse.

I belive the Medusa060 or Hades wins. My A1200/020/28 clocked in at 41.5

seconds with FastView, don't know how Visage would fare. It'd be
interesting to see what a 060 Amiga could do...

:
: The fact that Apple had models in the 80's which initially retailed for
: more than $5000 (some were closer to $10000) does not mean that they had
: an "academic mentality". It means only that they were targeting a much
: different market than Atari. IMO, it was a mistake for Atari to ignore
: that market, since targeting it would have given the ST much more
: credibility as a serious computer, as well as ensuring that Atari kept up
: with current technology instead of falling far behind like it did.
:

First...Atari felt it was making a good move...because in 1988 they went for the one market every one else was ignoring. The home user! Texas Instruments and Atari battled it out for this market early on... then came the C64. Next thing you know they all pulled out and left the market wide open. Atari simply couldn't afford to secure it...even thoe they gave it a try. At the time...the ST was the absolute BEST machine on the market for its price. I was running DOS and windows applications on my Atari, along with a great deal of Mac stuff (Both faster than the native machines I might add!), and saving my data to 3.5" floppys (two or three years later before this became standard on PCs)...running in full color, doing midi work... and much much more when my friends had paid up to 4 times the ST cost for an Apple GS, an XT, or the occasional (very rich) Mac user (and scraping to afford a simple MPU...let alone midi interfaces and sound cards). Today...I can still use my ST with only 1meg and do things that it takes a current Mac or PC at least 12meg of RAM and an awfully large hard disk to accomplish. So maybe TOS/GEM is old and outdated...but it's sure outlived the others when you consider it's only gotten four or five slight modifications, and DOS/Windows/SystemX.XX is constantly getting major plastic surgery just to make it useable.

Atari fell behind in technology?
Interesting that they hit the market first in many many areas...all the way to the last product...the Jag. Falcons came out when Pentiums were still a wet dream...In my opinion, Atari's big problem has never been with the machines they made and their respective OS. Axe to the grind stone... the Atari machines WORK with less problems than any other machine I've ever come in contact with for average (and some not so average) applications. It's really not fair to compare the latest stuff that just came out last year with stuff that came out 5 years ago (Falcon...longer for other Atari stuff)...and even so...the Atari CAN and DOES do most current computing needs. That's pretty good for a platform laid out in the early 80s!

The "few" dealers that carried Atari sold the hell out of them. The problem was that no one can see into the future. Trimmel was one major player who saw much success in making a good machine for cheap, and selling it in mass quantities (I.E. C64). He took a gamble with the same policy on Atari. The problem...by this time...free publicity was no longer existant like in the C64 days when editors lined up and begged to review the hottest new gadget. He didn't figure this into the equasion, and Atari no longer had money to push their lines. Furthermore, there were evidently some big jerks down in dealer support that managed to piss off the majority of local small Atari dealers...there went their last hope! Shortly, mail order and whare-house whole sale ruled the PC world. Now...I think it is basicly a matter of luck, and this time around Trimmel's seemingly logical move at the time lost. It easily could have gone the other way however...one never can tell...you make your best call and hope for the best.

Okay...are the Direct Computer Clones a good choice?
For a lot of applications...yes...
I doubt Direct Computers expects to sell a whole lot of these...espically to "home users". The people who will buy them are power users who might already have lots of TOS software. Or someone wanting to market a particular nich package based on the platform. For instance...
Say I'm a company who has been working on a project for the last ten years to make a machine to co-ordinate satellite uplinks. I already have ten years worth of code that was written in 68000 assembly language but just now are ready to select an existing machine to build the rest of the system around and go to market within the next two years.
I make a few phone calls...
I'm down to choosing between a Mac mother board, and the Direct TT.
Mac is all out of the particular one I need...the next model up that they will sell me without a chassis and other junk I don't need is going to run me about $1,000,000 more in the end, mainly because I have to get

a special commercial liscence to resolve some crazy legal problem with software drivers for the networking card I want to use that'll zap a whopping %15 royalty for every unit, or upgrade I sell. Going with an Intel set up means rewriting all the software at the expense of 10 years of work and research. (these are hypothectical but realistic instances here...so please don't fire specific flames here).

I call Direct computers, and they say they can make a run of the exact number I need, hack off what I don't need, and add what I do, and even make a bid on doing my final chassis for the ENTIRE system if I want...my lawyers say we're good to go with developing or obtaining everything we need for the platform without running into problems...Etc..Etc..Etc.....the machine meets my specs...so I buy about two thousand of them and contract to buy a whole bunch more over the next 5 years!

This will eventualy happen for Direct's TOS Clones if they hang in there and get some good sales people at hand to search out this demand. This kind of thing happens every day...I see enough nich hardware in the TV station I work in to know this is a fact. We've graphics systems that are based on VERY old technology...but they work better than anything else avilable. They are VERY EXPENSIVE...but the companies that made them have made decisions that most of us can't even imagine...usually resolving around legal and liscenseing issues. Believe me...if a company finds out they might be able to save a big bundle by going with TOS over some other system...they will do it! I've seen quite a few "industrial" computer manufactures pop up under similar circumstances to the TOS Clones at Direct TT. They've a good product on their hands...there's lots of applications that this machine is perfect for...and given a decent quanity to make a run of...it's very possible one could save big bucks going with the platform.

Oh, and by the way...Atari sold a lot more industrial computers than most realize...I've no idea how many...but every-where I go...I see these babys poping up in the strangest places!

Brian

Because it would have broken too many applications, and didn't seem
important enough when the competition was DOS.

Facts, you've got to be joking, you don't know anything about the Atari of today. At least you admit you have no knowledge of it, it's a start.

>> Well I'd never heared of that word and neither had my dictionary or my
>> Psion. I say there is no word at least not in the proper English
>> language, care to enlighten me?

>Try harder and use a different spelling..

The automatic correction offered no alternatives. It wasn't a case of poor spelling Pete, it was a lack of knowledge. When words are typed incorrectly the fall into a number of categories: bad typing (virtually all of mine), knowledge errors, grammar and spelling. You can't spell Rhapsody as Rhasopy or whatever the words sound nothing like eachother, you thought that was it's actual name same thing with Tempus/Tempo, you have absolutely no idea, I'm an atari owner and I knew what the bloody things were called and I'm not the one promoting them, if you try and advocate something, it does help to know what they are called.

JEDI writes:

> That's a poor choice of words. This text I am typing now 'accesses' the OS and by no means needs supervisor mode or to be running in the kernel.

> Those things which need to be there are by no means 'many'.

You asked what cannot be written at the application level and I told you. I am not claiming that any particular technology is best implemented in supervisor code.

> Those that do are attempting to supplant big iron.

And doing it successfully. There is no reason to not run a program that needs a few hundred megs of logical address space on a decent microcomputer using a decent OS. I don't include the Mac operating system here.

> Howso? They both have to deal with the same locality issues.

VM has a lot of hardware support for keeping track of page faults and page touch frequence/recency to pick victim pages. If you wanted to use that information in a disk caching algorithm then you would have to do it in software which would be much slower. Most "modern" operating systems (such as NT, IRIX, UNIX) use a good hardware supported VM scheme and a simpler disk caching scheme. Also remember that each time you read something from a (non-memory mapped) file you are invoking a function that will have a lot more overhead than simply accessing a memory address.

> That which is commonly used would be covered by MPEG.
> Even the rest which are often touted and less often seen
> would be covered by other formats (like vrml).

MPEG is a video format. QuickTime is a video engine. They are not directly comparible. For example, it is logical to ask "Can QuickTime play MPEGs?" (it can) but it is silly to ask "Can MPEG play AVI files?". QuickTime adds a great deal of functionality to your computer. It allows you to play back many animation and sound formats, it can control MIDI devices and it can control video digitizers. This gives programmers a powerful API to create multimedia applications. I wrote a digitizing program for the Mac once and the digitizing component was only about a fifty lines long.

It was just a prod to get a response from the other two debating
the speed of their systems. I included the 10.2 second Falcon time
just for giggles. Tim has come back and stated that for his PPC
the time was 1.9 (I think) seconds for this file using Graphics
Converter. But, he didn't actually time it the same was as was
discussed. I may have missed what Chris posted.

While were here, do any of the 060 cards available for the Amiga
work with your A1200? I have considered lately looking into a second
hand unit as I have found some Toaster hardware that I can
get my hands on. I usually once a month pick up VTU, but it's
not the same as the old Amiga World. I have to "learn" about
the h/w by reading the dealer adds. Is it really necessary to
go with the 4000T or would a lower spec model work specifically
for the task of video capture and utilizing the 060 upgrade?

Mike

Sorry, I was actually talking about Tempus 2, I never saw the
original, I'm not sure if it was released here.

>I guarantee you that it is easily possible to write a DOS application
>which will whip the pants off of anything in scrolling speed.

It's a big shame that nobody has done it then, Tempus 2 will also run
in a multitaking environment such as Magic so thats a bunus too. Also
I wan't only talking about scrolling speed, it was just an example,
things like Search and replace are instant, a 2 meg file can be
re-formatted within a few seconds. Pound for pound a 601 at 90mhz or
any faster chip should really be able to absolutely blow Tempus 2 many
times over, however as you admit there may be something faster
possible but I would say there is nothing that is as efficient with
processing power as Tempus 2 and sadly I doubt there ever will be.

>The
>advantage Tempus 2 has over programs you have likely compared it to is

>that it only has 32000 bytes of screen memory to update when scrolling.

>potential scroll speed is impressive.

As you say, potential, the apps don't appear to exist and certainly
not on the more modern windowed, multi-taksing systems.

Quite right, memory is at an all time low, the latest prices are
unbelieveable, in the UK they have dropped more than 50% within the

last 2 months or so.

>> then great OS sophistication really isn't

>>   rhetoric, you have said nothing. How does TOS limit the user? Which
>>   of these limits is not addressed by MagiC 4.0?
>
>Does it have VM? No?

VM is available on machines that have the power to support it with
utilities like Outside, it's not built into the OS as it is not
particularly useful, my machine has a mere 4 Megabytes and the only
time I see the out of memory dialog is when I'm using a utility that
does not dynamically allocate ram and I only have 2 of them.

>Well, that's an obvious start. Does it have much
>in the way of network support? No?

Not really, they were never really meant to be networed machines, it's
not useful in the case of the vast majority of Atari owners.

>Does it have memory protection? No?

Magic has very good memory protection, I've had quite a few crashes
but one that brings down Magic is a very rare sight, magic handles
errors very well.

>Sounds like a limitation to me. (Maybe things have changed, but in my
>Atarian days there was little to no support for any of these things, and I
>haven't seen evidence of them in my fiddling with MagiCMac.)

I'm not sure if MM handles things differently, I've not had a chance
to use it much yet.

>Does TOS have a 3D graphics API? Does it support hardware acceleration
>for it? MAJOR limitation. This is hardware of today we're talking about.

No need for it sadly the game sindustry on the Atari is all but dead,
that's why I bought a PSX.

Supply and Demand, it's a good machine, the machine is worth this to some people, people who know about Atari systems will see it's true worth although of course it would be nice if it was a bit cheaper, in small quantities howver this is VERY difficult.

>> Tell me, what is a "3D appearance manager"?

Quite right, current trends are: Processor power doubles every year,
Memory density doubles every 2 years, disk capacity every 3 years,
seek rates double every 10 years.
At these rates by 2003 memory will be more efficient than disk
(including the price). Sounds good news to me.

>You were talking about MagiC. I assumed that MagiCMac is the same OS,
>just running on a Mac instead of an Atari. Did I assume wrong? I thought
>that was the idea behind MagiCMac.

There are differences but they are more technical, to the end user
there should be very few differences in terms of features.

No they just call the Quicktime application, it's not really a part of
the OS, merely a componens supplied with it by default.

I tried one of the benchmarks that was there, too (FPUTEST, which had C source). Here's the results for my machine, along with the last few lines of results already in the source: (times are in seconds)

```
    5.39      25.54     Definicon 780+, 20 MHz 68020/68881 SVS C

    5.12      23.75     Definicon 785, 25MHz 68020/20MHz 68881, SVS C

    3.18      12.275    Atari Mega ST2, PAK3/030, 32 MHz 68030/68882,
                   Pure C 1.1 generating Inline 68881 Code

    0.1053     0.1267   Apple Power Macintosh 7500/100 upgraded to 604/155
                        No L2 cache
                        CodeWarrior 10 with max 604 optimizations
```

(The lack of a L2 cache probably doesn't hurt me on this one, since I suspect the code and data both fit into the L1 processor cache.)

```
>I forget now, but either Graphics Converter or DeBabelizer allows you
>to choose Quicktime or not.

GC does have its own decompressor.  I tried it, and it's slower than the
QuickTime code.

>
>Yea, the hardware is bitchen. I just like the simplicity of TOS or
>MagiC.

I really think you should check BeOS out, then.  It is simplistic, but
less so than TOS or MagiC.  And it is very, very fast.  If you can get
hold of a copy of the January MacTech magazine, it has a CD with BeOS
DR8.2 for PowerMac that will run on any PCI PowerMac.

I've had crashes with it, situations where something goes obviously wrong
that prevents the system from responding.  But it is pretty stable for a
"developer release", on non-Be hardware.  I won't be running it as my main
OS, but I am seriously thinking about keeping it as a cool OS to hack
under (it is very easy to write multithreaded windowed apps in BeOS -- you
practically can't avoid writing them that way).

Quite possibly not. You don't have to worry about eking every last bit of speed out of a PowerPC to get a responsive and fast word processor.

Interestingly, WordPerfect for PowerMac may be partially assembly. There is a company that offers 68000->PowerPC and x86->PowerPC assembly porting tools and services. They list WordPerfect as one of their major customers; apparently much of it was originally written in 68K ASM and they made use of the porting tools to transform it into PPC ASM. I doubt, though, that very much of it would be written in ASM if they wrote it from the ground up today.

Applications should not directly access the computer's hardware. QuickTime does so it is best considered a part of the operating system.

How about a simple implementation where the OS simulates the failed
read/write and gives the app the data, and then passes some sort of
"you've done something bad" message to the app, along with details of what
it did? This can, I believe, give a smoother transition into full memory
protection later.

Oh, and the competition for the Mac was the workstation market - or at
least that was how it seemed to me at the time. The Plus and other low-end
models were the ones targeted at SOD.

The issue with memory protection is all the system globals in low memory. It's tough to prevent an application from mucking with entries for another process or the system.

Remember, too, that in those days, A/UX was thought to be Apple's entry into the workstation market. They didn't sell enough copies to keep that product alive.

|> Oh, and the competition for the Mac was the workstation market - or
|> at least that was how it seemed to me at the time.

Not me. I was in a technical group, where the primary product was technical info. Lots of Macs, a few PCs, and some windowing terminals. Almost no workstations.

OK, stopwatch time for ab.jpg from your FTP directory, once the file is
loading from cache instead of disk, is 1.6 seconds.  That's from the time
when I double click the file to the time GraphicConverter actually
displays it.  Performance is the same if I put the file on a RAMdisk.

Yes, but yours is still an interesting time, since it is more at the level
of the usual user.

: While were here, do any of the 060 cards available for the Amiga
: work with your A1200? I have considered lately looking into a second
: hand unit as I have found some Toaster hardware that I can
: get my hands on. I usually once a month pick up VTU, but it's
: not the same as the old Amiga World. I have to "learn" about
: the h/w by reading the dealer adds. Is it really necessary to
: go with the 4000T or would a lower spec model work specifically
: for the task of video capture and utilizing the 060 upgrade?

There is the Blizzard A1260, which works well (AFAIK) in a standard A1200
(No heating problems, which the 040 boards often have).
The Toaster is, to my knowledge, still a card you put in the video bus,
which only the big-box Amigas have, the 2000, 3000 and 4000, unless you

upgrade your 1200 with an expensive Tower and bus solution.
If you don't need the Toaster specifically, there are other frame
grabbers, such as the Vidi-Amiga and V-Lab.

The 2mb/sec was a built in feature Atari provided:(. The IDE however
is not limited in this way. On my machine, depending which driver and
drive is connected, speeds upto ~3.8mb/sec are possible depending on
how your drive is set up and your cache options. The speed also seems
to float with the bus speed, but i'm running standard Mhz so I can't
really say what it tops out at (yet).

No PowerMac at home. At work we can only use "approved" O/S's and i'm
not sure the Gov has made a statement on this yet. I have to run MagiC
off my EZ135 at work to be "legal".
>

I play with imaging to much to be considered an active beta tester:).
The Mac and two Falcons are usually busy "processing" which leaves me
my 36MHz 68000 Mega ST :).

Yes, thats a no no. It tends to speed things up:).

>QuickTime does so it is best considered a part of the operating system.

Has the bug in QuickTime been fixed where it causes some digital
video apps data stream to be inverted? I still notice it when
converting a QuickTime file to MPEG format at times.

I've several original boxed, unused Atari games (including some of those
below) that I'm trying to sell. If anyone's interested, a comprehensive
list, (including postage incl. prices - within the UK) can be viewed at:

http://www.polyprss.demon.co.uk/atari.html

those also fonts at /fonts.html and clipart at /clipart.html

feel able to browse at leisure. Or email for whichever list(s) you'd like
to see.

Regards

Kevin

Final Notice: IEEE's COMPCON 97 Set for Feb. 23-27 in San Jose

Visit the COMPCON 97 World Wide Web page for more information and/or to register:
URL: http://www.compcon.org

or read the following :)

SAN JOSE, Calif., -- One of the country's pre-eminent computer technology conferences -- Compcon 97 -- will be held February 23-26, 1997 here in the heart of the Silicon Valley. This continues a tradition of more than 40 successful years in the San Francisco Bay Area for this non-profit technical conference.

"Hot Systems/Cool Software" is the theme of COMPCON 97, underscoring the importance of new computing technologies and applications in both the computer industry and society.

"Computer technologies ranging from world-record 600MHz processors to eye-catching Java applets and VRML virtual worlds will all be featured at COMPCON 97," said Darrell Long, the conference chair and computer science professor at University of California-Santa Cruz. "COMPCON has the reputation as a one-stop, no-hype overview of the important developments in our industry. If you could only attend one technical conference a year to learn about the overall state of the industry, COMPCON would be your choice."

Adds Dr. Joel Birnbaum, Vice President, R&D and Director of HP Labs: "COMPCON has been consistently a valuable conference presenting a broad technical program on state-of-the-art computing technologies."

IEEE COMPCON 97 will be held at the San Jose Hilton and Towers Hotel (300 Almaden Blvd.) in downtown San Jose, Calif.

COMPCON is sponsored by the Institute for Electrical and Electronics Engineers (IEEE), a non-profit professional association, and has been held in the Bay Area annually since 1955.

Its 27 technical sessions and six in-depth tutorial topics run the gamut from the design of advanced central processing units and networks to computer systems, advanced programming and world wide web technologies. In addition, five well-known industry luminaries will give plenary talks. COMPCON has no marketing presentations or product exhibitions.

COMPCON 97 program overview:

INTERNET/INTRANET TECHNOLOGY: Trends, Environments, Applications

SYSTEMS: Superservers, Mobility, Software Architecture

MICROPROCESSORS: High-Performance, Low-Power

INTERCONNECTS: Parallel Computers, LAN and WAN, Wireless

VIDEO: Advanced Displays, Digital

MULTIMEDIA: Technologies, Software Environments, Applications

PARALLEL/DISTRIBUTED SYSTEMS: Applications, Hardware, Compilers

OPERATING SYSTEMS: Object-Oriented, Microkernels

PERIPHERALS: Mass Storage, DVDs, Display Technologies

EMERGING TECHNOLOGIES: GigaHertz Devices, Advanced Hardware, Java

Tutorial topics include: 3-D graphics, virtual reality, web site design and security, advances in computer architecture.

Plenary speakers include:

Federico Faggin (Synaptics) -- "The Microprocessor: Its History and Future"

Hector Garcia-Molina (Stanford) -- "Meta-Searching Across the Internet"

David K. Gifford (MIT and OpenMarket) -- "The Future of Electronic Commerce"

Ted Laliotis (Laliotis and Associates) -- "To Tax or Not to Tax Internet Transactions"

Dave Nagel, AT&T

Advance reservations to Compcon 97 can be made through the web site or by contacting:

Dave Hunt, COMPCON 97 Registrar
Lawrence Livermore National Lab
PO Box 808 MS L-130,
Livermore, CA 94551-0808
E-mail: hunt-dn@llnl.gov

: >   quite easy to demonstrate with a microcomputer.

: You're really exxagerating the performance hit quite well. I congratulate
: you on your use of polemics.

: In reality, VM performance hits are not the step function you suggest.
: You do not go directly from 100% performance to 5% or worse. There are a
: large number of situations where VM is active without impacting
: performance much at all. Sure, if you get your computer into thrashing
: behavior, performance will go to hell, but that's a characteristic of any
: caching system. Modern computer architecture is all about memory
: hierarchies and avoiding thrashing behavior between the various levels.
: VM is no different.

: >>server to have decent performance, you must put enough RAM in it so that
: >>it doesn't have to swap often, or else users will complain that the
: >>machine is a slug).
: >
: >   Two words: Resin Fire.

: And what the hell is that non sequitur supposed to mean?

: Oh, wait, I get it. You're trying to make an obscure and clever reference
: to the scare that artificially inflated memory prices a while back.
: Unfortunately, as a response to the point I was making, it falls flat on
: its face.

: >>So what's your point? That we should stay mired in the backwaters of
: >>computing just to be absolutely guaranteed that a disk swap operation will
: >>never happen?
: >
: >   So? How is TOS a backwater? One has yet to address that. All you
: >   MacVocates can come up with are application level toys.

: Ah, so now I'm a MacVocate. Funny, I don't seem to recall this thread, or
: at least my participation in it, being about the Mac for quite some time
: now.

: For the record, I have many beefs with the MacOS. I own a Mac, partially
: because it's the last hope for non-Wintel personal computers, but I am not
: uncritical of it.

Well,maybe with Linux it's useable...

: >   However, since Petey-Boy himself seems to think that the OS is just
: >   a pathway to the apps,

: I don't care what Peter thinks. You're not arguing with Peter. You're
: arguing with ME.

: >   grafted upon TOS at the applications level. Most of what they have
: >   are bells and whistles.

: There are many things which cannot be grafted at the application level.

: >   Software should be designed to run on the hardware of today, no 4
: >   years in the future. While petty justifications for braggadocio are
: >   nice and all, computers are tools in the end. They either do the task
: >   you desire in a satisfactory fashion, or they do not. Beyond childish
: >   rhetoric, you have said nothing. How does TOS limit the user? Which
: >   of these limits is not addressed by MagiC 4.0?

: Does it have VM? No? Well, that's an obvious start. Does it have much
: in the way of network support? No? Does it have memory protection? No?
: Sounds like a limitation to me. (Maybe things have changed, but in my
: Atarian days there was little to no support for any of these things, and I
: haven't seen evidence of them in my fiddling with MagiCMac.)

: Does TOS have a 3D graphics API? Does it support hardware acceleration
: for it? MAJOR limitation. This is hardware of today we're talking about.

uh,what does 3D graphics have to do with anything?
That's really a driver-level task.(or shared library)

: Does TOS have anything like QuickTime?

Isn't QuickTime a thing like PC's AVI files?
I don't see what animation has to do with OSes.Do you know what TOS is?

>IBM's decision not to support WIN32 in Warp 4.0 has been the turning point for me. Big mistake,

I agree 100%. I've been using os/2 for over 5 years and it will cost a few $1000 to switch to NT but without full win32 support, OS/2 is simply not going to remain a viable product.

What would it take to interface win-32 to PM???

: Your postings get more bizarre each time.

: Running out of memory has nothing to do with the OS in question. It's a
: matter of using the memory for programs. If you crank up enough of them
: you will run out. If you run a single program that needs more than you
: have free, you will run out.

: >>I would be very surprised, based on your postings, if you had much of a
: >>grasp of computer architecture. If you do, you sure aren't using it.
: >
: >   I have enough to know that SCSI fast wide (or even RAID) doesn't quite
: >   compare to multiple IO channels or solid state disk.

: Um, you just demonstrated that you can masterfully make a dumb
: comparison. Big machines might have multiple I/O channels for a RAID --
: what do you think each of those channels is? Very often, fast/wide SCSI.
: You can buy dual-channel UltraSCSI cards for Macs; they're intended mainly
: for RAIDs. (Single-channel RAIDs are possible, but not as fast.)

: >   Furthermore, such knowledge really isn't required. All that I have
: >   said can be demonstrated empirically with no technical understanding
: >   needed.

: First you say you have knowledge of computer architecture, as a way of
: trying to bolster your argument, now you say you don't need it. Make up
: your mind.

: >[deletia]
: >>You're really exxagerating the performance hit quite well. I congratulate
: >>you on your use of polemics.
: >
: >   Then I challenge any interested parties to test for themselves.
: >
: >   8ms is a lot faster than 150ns no matter what kind of spin you
: >   try to put on things.

: Strange that people don't use hard drives instead of DRAM, then.

: OK, that's a cheap shot. I'll give you the benefit of the doubt and
: assume that you really meant to type it reversed. Simple mistake,
: everybody does it.

: However, you should really look at VM in this light: VM is like having a

: large but very slow memory cached by the computer's DRAM. The computer's
: DRAM is in turn cached by an external "L2" cache, which is in turn cached
: by a internal CPU cache. Ultimately, the CPU keeps data it is currently
: operating on in extremely fast registers. Each level in this memory
: hierarchy is much slower than the one which preceded it. The idea is to
: avoid too many misses so that fetching from the next slowest member
: doesn't happen often.

: The reward is that if the miss rate is kept down, you can make a slower
: but cheap memory perform almost as well as a faster but more expensive
: memory. The techniques for reducing miss rates are well known and are the
: subject of intense research by computer architects. Although the
: techniques used for caches are somewhat different from those used for VM,
: there is a striking amount of similarity.

: Furthermore, both systems have breakdowns. Just as VM can sit there and
: grind the disk continuously, L2 cache can exhibit thrashing behavior which
: makes the system perform worse than it would without any L2 cache.

: In both cases, though, the benefits are too good to ignore.

: >>And what the hell is that non sequitur supposed to mean?
: >
: >   It means that some of us have been doing this for awhile and
: >   have actual empirical knowledge of the subject that trumps
: >   quite a bit of what academia may be feeding you. It's a shame
: >   they don't quite feed you enough.

: Ah, an anti-academic. If you can't win an argument, try to paint the
: opponent as living in an ivory tower.

: >>Oh, wait, I get it. You're trying to make an obscure and clever reference
: >
: > Amongst memory consumers, the reference is by no means obscure.

: I am a memory consumer who was hurt by the incident, yet it took me a
: while to remember.

: >>to the scare that artificially inflated memory prices a while back.
: >>Unfortunately, as a response to the point I was making, it falls flat on
: >>its face.
: >
: >   Money is never irrelevant.

: So you're trying to say that because RAM was excessively expensive for a
: while, virtual memory is bad? Sorry, either you're gibbering, or you're
: trying to sidetrack from the issue of whether VM is a Good Thing.

: > Perhaps this is the reason Mac is in its
: >   current state. When I got my first ST, you could buy a new car for
: >   less than some Macs. They're trapped in an academic mentality and
: >   aren't capable of real engineering.

: The fact that Apple had models in the 80's which initially retailed for
: more than $5000 (some were closer to $10000) does not mean that they had
: an "academic mentality". It means only that they were targeting a much
: different market than Atari. IMO, it was a mistake for Atari to ignore
: that market, since targeting it would have given the ST much more
: credibility as a serious computer, as well as ensuring that Atari kept up
: with current technology instead of falling far behind like it did.

: It was also a mistake for Apple to ignore the low-cost market until recent
: years. There is no rule that says you cannot design a machine which is
: easily scaled to several levels of price/performance.

: >   We are just fortunate that RAM doesn't impose the same kind of
: >   constraints that it once did. To believe that it never will again
: >   to the same extent is grossly naive.

: In the long run, RAM will get cheaper and denser. This is a very
: non-naive idea based on knowledge of what goes on in semiconductor
: manufacturing. The price scare of a few years ago and the current low
: prices are symptoms of a commodity market. But nothing will change the
: fact that roughly every 1.7 years (if I remember correctly), DRAM density
: quadruples. This is a rule which has held true for 20 years or more.
: It's why I paid $50 or so for 256K of RAM to upgrade my 800XL in the 80's
: and paid $90 for 16 MB of RAM a few months ago.

: >>There are many things which cannot be grafted at the application level.
: >
: >   Like What?

: Like anything which needs to be global and standardized. You could try to
: graft something like UNIX pipes onto programs at the application level,
: but it wouldn't be nearly as good as if it were done in the OS itself.

Why not just put it in a seperate programme and then everything accesses
that programme?

 : >[deletia]
: >>Does it have VM? No? Well, that's an obvious start. Does it have much
: >
: >   It's a poor start. VM is not at all necessary. In microcomputers,
: >   it only serves to allow developers to be immensely sloppy.

: How is it sloppy to be unable to anticipate that J. Random User will try
: to run fifteen programs simultaneously on his 4 MB Mac LC? Each of those
: programs could be as tightly coded as possible and J.R.U. would still run
: out of RAM.

I think the point is that developers wouldn't try as hard to optimize.

: I really think you're pulling this out of your hat. Most developers have
: to try to code for the lowest common denominator. That automatically
: includes trying to avoid dependence on large amounts of memory being
: present. As the average user gets more and more memory, developers set

: the bar higher and higher, but in no case do they just sit around saying
: "hehe, let's make our software a pig, we don't care, we don't have to".

: Some developers are clearly much worse at efficiency than others. For
: example, Microsoft Word 6 for the Mac is an insufferable pig, both for the
: CPU cycles it burns and the memory it eats. The user reaction was to dump
: it, something which was probably a factor in Microsoft's recent
: announcement of its creation of a new Mac product division which will
: develop Mac products from the ground up. (As opposed to the current
: policy of doing poor ports from the Windows versions.)

: >   Memory Management would be a much better 'modern' requirement.

: Define "Memory Management".

: >>in the way of network support? No? Does it have memory protection? No?
: >
: >   Actually, MagiC does. Network support can exist on the application
: >   level and has been existent on the ST's for quite some time.

: Network support needs to be an OS service. It is too much to ask every
: application developer to reinvent the wheel.

Why not make it a server like a FTP server.
I have a programme called "WHATIS" on the ST,and I can just type
"WHATIS *.*"
to find out what type of file (BASIC,ML,picture...) each file in the
current directory is.I can also access it through the accesory menu.
The point is that ALL programmes can talk to WHATIS if it's made resident.
They can ask it "What does this header mean" and so forth.
Even if it couldn't be made resident,they could still run on a file
everytime they need to know.(like UNIX)
Doesn't Mac have inter-process comunication?

: MiNT/MultiTOS probably have at least a TCP/IP protocol stack, but there
: seem to be very few people that use those particular offshoots of TOS.

: It is always very funny to see the extremist Atari advocates gloat about
: the LocalTalk compatible port on the Falcon. They never mention the fact
: that Atari didn't have an AppleTalk network driver (and, to the best of my
: knowledge, nobody outside of Atari has ever written one either). A
: network port without the software to support it is worthless.

: >>Sounds like a limitation to me. (Maybe things have changed, but in my
: >>Atarian days there was little to no support for any of these things, and I
: >>haven't seen evidence of them in my fiddling with MagiCMac.)
: >
: >   I'll consider this methodology the next time I fire up the PC
: >   Mac emulator: Executor. '-p

: You were talking about MagiC. I assumed that MagiCMac is the same OS,
: just running on a Mac instead of an Atari. Did I assume wrong? I thought
: that was the idea behind MagiCMac.

: >>Does TOS have a 3D graphics API? Does it support hardware acceleration
: >>for it? MAJOR limitation. This is hardware of today we're talking about.
: >
: >   API's are all applications level.

: You have an odd definition of "application level". Usually it refers to
: code that sits in an application instead of in an OS. An API is the
: interface offered to an application for an OS service.

Or it could be in a shared library.Or simply a small programme that
everybody(programmes) run that most all have.(like grep in UNIX)

: >   Although 3D hardware acceleration would be a nice addition.
: >   However, this could also be added to TOS with no problems.

: That doesn't change the fact that it's not there.

Well a infinite number of things aren't in there.

: >>Does TOS have anything like QuickTime?
: >
: >   For those parts of QT that actually get used: yes.

: What parts do you think don't get used?

He probably means the part to put graphics on the screen,as opossed to the
part that de-codes the MOV file in to said graphics.

 : >   Although, this is applications level as well.

: Is it? Is it practical to expect every developer who wants to include
: digital motion video in their program to reinvent all of the technology
: that's present in QuickTime? QT means that programmers can easily
: implement fairly advanced features in their programs with minimal effort.
: It means that you don't have to worry about interoperability with other
: digital video programs, because if you use QuickTime you automatically get
: it. Just as an example, you can cut, copy and paste chunks of video using
: standard Mac clipboard operations between any two apps which support
: QuickTime.

: This would be extremely impractical to do at the application level.

Once again,doesn't the MAC have IPC?
(or shared libraries)

I was not aware of this bug so I can't say. The newest version of QT is 2.5 so if you are using that then the bug hasn't been fixed.

>uh,what does 3D graphics have to do with anything?

>That's really a driver-level task.(or shared library)

Actually, a layered approach is best when considering 3D graphics. The Mac
has the following layers:

QuickDraw 3D (shared library)
RAVE (shared library)
RAVE driver (driver)

The idea is that the application programmer gets a nice highlevel API
without having to worry about how the scene is actually being rendered.
As far as I know, TOS does not include a highlevel (or any level) 3D graphics
API.

>Isn't QuickTime a thing like PC's AVI files?
>I don't see what animation has to do with OSes.Do you know what TOS is?

QuickTime is not a file format, it is a multimedia engin.

I will explain this in small words, so that the other janitors at University
of Northern Iowa can translate it to whatever dialect of simian ASL you
understand.

Your spamming costs me money. Notice my email address on this post; I pay
for my Internet access, and for my entire domain's access. Therefore, your
spamming IS my business. Your sysadmin has basically said he doesn't give a
shit - but if this continues, I'll ask Chris Lewis to get involved, and then
your sysadmin WILL learn to give a shit, becasue Chris Lewis is capable of
convincing all other admins (or a significant percentage of them) to UDP the
uni.edu domain for spamming. That would be greatly inconvenient to the
University adminstration and students. Eventually, the source would be
traced to you and your buddy in whatever uni.edu calls the information
technology department.

Is that simple and clear enough?

Followups set, as usual.

See below.

>: Does TOS have anything like QuickTime?
>
>Isn't QuickTime a thing like PC's AVI files?

No. AVI is just a simple movie format. QT is a generalized format for
data played over time (QT tracks can contain all sorts of different
things). QT is also a complete set of operating system calls to manage QT
data, so that if you are a programmer, you don't have to worry about the
details of it yourself.

>I don't see what animation has to do with OSes.Do you know what TOS is?

Yes. I owned a TOS computer for several years.

In this day and age, a personal computer operating system is expected to
provide a wide array of services above and beyond the basics (memory
allocation, process management, file systems, and basic I/O).

BTW, next time you reply to something, please trim the parts of the post
you aren't responding to.

Are these results from the DSP bench program?

The FP looks pretty slow. I do recall, though, that the Falcon used the
56001, which is a fixed-point DSP, so that's not unexpected.

```

```

I'm not sure if it exists for the Q900, but I know of a 50 MHz 68040
upgrade for the 660AV which plugs into the 040 PGA socket. I assume you
have to remove the Diimo card because both it and the DOS card use the
Quadra PDS slot?

The Falcon was not a "first". Atari talked about it for an awful long time before actually releasing it, and by the time they did, it was no longer a blockbuster product. You could spend a couple hundred more to get a Mac Quadra 660AV, which had a lot better hardware overall than the Falcon. (I'm not sure that the Quadra was released prior to the Falcon... but NeXT had a 56000 series DSP onboard *long* before the Falcon.)

The ST was not a first. It was clearly a followup to the Mac: offer a cheap GUI alternative to the Amiga and Mac (both of which were more expensive than the ST).

The TT was not a first. 030 machines existed long before Atari finally got on the bandwagon.

Atari was behind the technology curve throughout the Tramiel years. The Jag is possibly the only exception, but they killed it with the trademark Atari cheesy support and marketing.

I was thinking along the lines of 1989-ish, as that was when I started to become Mac-aware. (I believe that 1989 was named "Year Of The CPU" in Mac circles as each new machine was bigger/better/faster than the one before it). And that A/UX was reviewed as Apple's push towards the workstation market - "a full Unix, with a Mac user interface" or similar. But that was from a PC mag from the long-gone time when PC mags covered Amigas, Ataris, Macs, Intel-based PCs and other different computers in the same issue.

: Applications should not directly access the computer's hardware. QuickTime
: does so it is best considered a part of the operating system.

Whether or not applications should directly access the hardware is a question which isn't likely to be answered any time soon.

There are two points of view:

1. Applications should directly access the computer's hardware. This allows maximum performance with minimal interference from the OS (which can slow things down) and minimal overhead inside the OS (because it need not support the hardware, it only need support the driver and direct access). It does leave large security holes if implemented incorrectly (e.g., an application could scribble on the kernel), and doesn't allow effective use of multiple graphics applications at the same time.

2. Applications should never access the computer's hardware, they should tell something else to. This allows maximum security, because driver for the card controls everything that is done with the card. It also allows the use of multiple graphics applications at the same time (like running two X clients at the same time). It does add overhead because the driver must be called each time something is done and also adds time to the development of the driver.

How does this apply to Quicktime? Well, QT access the hardware directly (according to Brian; I'm not familiar with it myself). This could make it a part of the operating system by definition 2, because that definition disallows the possibility of something accessing the hardware directly and not being part of the OS. But by definition 1, it could be a user space driver, because they don't have to be part of the OS.

Whether or not it is part of the OS or simply a user space driver is to be decided on your own, but just because something accesses the hardware directly doesn't automatically make it part of the OS.

Yep. Solely because of the Finder's methods for getting the icons for the
files. The benefit of that approach is that every file can have its own
icon, and you never have to (as a user) assign icons to file types.

>Atari programmers on the other hand, do it for the love of the machine
>and enjoy the satisfaction of achieving great things from small code.

That's a bigoted attitude to take. You really think all non-Atari
programmers are corporate automatons? I can assure you that if you look,
there are plenty of lean&mean programs for any platform, written by people
who do enjoy the satisfaction of code bumming.

>Many Atari programmers work in machine assembly code, a corporate no-no
>in the Mac and PC market.

Assembly is hardly a "corporate no-no". There are tons of commercial
programs which use it.

Writing programs entirely in assembly is out, though. There's no purpose
in it, no matter what the assembly fanatics tell you. There are classic
rules of thumb for writing good code; one of them is that your program
will spend 90% of its CPU time in 10% of the code. Speeding up that 10%
with assembly is very desirable. The rest of the program? If you rewrite
